भाषापरिच्छेदः ॥

D I V I S I O N

OF THE

CATEGORIES OF THE NYA'YA PHILOSOPHY,

WITH A COMMENTARY

BY

VISWANATHA PANCHANANA,

EDITED, AND THE TEXT TRANSLATED FROM THE ORIGINAL SANSKRIT,

By Dr. E. RÖER.

CALCUTTA:

PRINTED BY J. THOMAS, BAPTIST MISSION PRESS.

1850.

T R A N S L A T I O N

P R E F A C E.

THE Asiatic Society accepted already in 1847 my offer to publish the text of the Nyāya with a translation, but only the Introduction to this work appeared in the Journal of the Society, the MS. of the translation having meanwhile been lost (*vide* Journal of the Asiatic Society, July, 1847). The present translation is based upon a rough copy of the former, which I afterwards found among my papers. The notes are entirely new, and the introduction has received so many additions, that it is almost a new essay. The Sanscrit text, in accordance with an enlarged plan, is now accompanied with its commentary; it will thus form another edition of the one published by the Committee of Public Instruction, which is out of print, and satisfy thereby a desideratum, long felt in the Government Sanscrit Colleges, where the Bhāsha Parichēda is introduced as a class-book.

INTRODUCTION.

IN the following introduction to a translation of the Bhāsha Pāricchēda,* one of the most celebrated works of the Nyāya philosophy, it has been my endeavour to subject the logic of the Nyāya, as well as the leading ideas of this and the Vaiśeṣika systems, to a critical review, in order to bring the discussion about the merits of the philosophical researches of the Hindus more to a point. Colebrooke's exposition of those systems, though founded on the ablest and most exact researches, as well in a philosophical as in a critical point of view, does not suffice for this purpose, as it is a mere abstract from the works of those schools, and does not enter upon the discussion of the position they are to hold as systems of philosophy.

It is well known, how difficult it is to write a history of ancient India, only a few strictly historical records having been left to us by the Hindus themselves. The same difficulty obtains with regard to the history of their philosophy, as in the mind of the Hindus philosophy was associated with the idea of being raised above change, and no regard therefore paid to the social and intellectual condition of the time, in which lived the founder of a system or his successors who more

* I have translated Bhāsha, in deviation from its ordinary sense "speech," by "categories of the Nyāya philosophy;" for Bhāsha means here evidently not "speech" in general, which would give no sense whatever, but "Nyāya Bhāsha," speech in the Nyāya, that is to say the philosophical language or terms of the Nyāya. In the Śabdā Kalpa Druma, "Bhāsha" (under the head of Bhāsha Pāricchēda) has the meaning of Paribhāsha, which is explained by the authoritative language of the teachers which considers the meanings of the words (Padārtha). This sense agrees essentially with the rendering which I have given.

developed it. Still it is not impossible to write a history of Indian philosophy, if it be limited to the task of tracing the gradual development of philosophical principles and modes of thinking, without reference to a strict chronological order; for the internal nature of a doctrine will point out its more ancient or modern date. At the same time we must admit, that even in this attempt, we can only partially succeed. The doctrines even of those who are considered as the founders of the different schools, bear the marks of a far advanced progress in systematical arrangement, and must therefore have been the result of a long series of preceding philosophical enquiries.* Hence it would be preposterous to expect, that we should be able to discover the first steps of their researches. We, however, decline here embarking upon a historical research of such a kind, believing, that under the present circumstances, when only so few of their philosophical works have

* Lassen's *Indische Alterthumskunde*, vol. ii. p. 477. His (Pāṇini's) text-book continued to be the norm of the whole following time, and the labours of his successors were limited to the task to narrow or amplify his rules or more lucidly to arrange them. From his work the same effect results, as from other pursuits of the Hindus on the field of science. By a person of superior talent the labours of his predecessors were rendered more perfect and brought to a close; he united them in a system of rules, or Sūtras, which he condensed as much as possible. This exposition remained the standard of all later times, and formed the foundation for the succeeding teachers of the same science, whose efforts were in general directed to the correct explanation and elucidation as well as to the emendation and perfection of the fundamental work, and by whom the science was carried to a higher degree only as to its extent, but not as to its contents. We may discover a double motive, from which this manner of exposition took its rise. First, the sum total of the results which had been gained, should be condensed in the shortest form and hence the learning by rote facilitated.... Secondly, this mode of exposition rendered the understanding of the text difficult and often impossible, unless it was accompanied by an explanation. Such an explanation was at the disposal of the teachers, and by their guidance alone the pupils were able to comprehend the obscure sense of the text-books. The Brāhmins, the only possessors of the sciences, thus secured for themselves the privilege of communicating them only to those whom they thought worthy of this information, and of preventing the other castes from an initiation with them. It is only in this sense that a secret doctrine of the Brāhmins can be admitted. From the circumstance, that for each single science text-books of this kind were generally acknowledged as standards, it was a consequence, that the works of the first founders and of the predecessors of the person who brought a science to perfection, were forgotten and frequently lost.

been published, and in general so many more materials are required for the task than we can boast to possess, it is more important to place an original work of Hindu philosophy before the public, and to examine the principles under which it has been constructed. For this end we consider the Nyāya in that shape, which it has acquired by its amalgamation with the doctrines of the Vaisēshika, since we are of Colebrooke's opinion, that both sprang from the same root, and are but branches of the same school; the one being directed more to the explanation of material, the other of logical forms.* Or to state it more exactly,—to the Nyāya belong the logical doctrines of the forms of syllogisms, terms and propositions; to the Vaisēshika the systematical explanation of the categories (the simplest metaphysical ideas) of the metaphysical, physical, and psychical notions, which notions are hardly touched upon in Gautama's (the supposed founder of the Nyāya) Sūtras. They differ in their statement of the several modes of proof; the Nyāya asserting four modes of proof—from perception, inference, analogy, and verbal communication; the Vaisēshika admitting only the two first ones.†

The name of logic, usually applied to the Nyāya, does not correctly define it. It does not treat of the theory of syllogisms and the notions connected with them, as its direct object, but only as a component part of its investigation. It rather aspires to the distinction of giving a complete system of philosophy, based upon the most elementary metaphysical notions, and the division dedicated to the explanation of syllogistical forms, is not even more explicitly treated than other parts of the system. To call the Nyāya logic, would be the same as to assign this name to the philosophy of Aristotle. There is no doubt, however, that the Nyāya has first among the philosophical systems of the Hindus thoroughly examined the art of reasoning, and shaped it into its present form. Hence it gained such ascendancy among the learned Hindus, that all of them, however they may deviate from other doctrines of the Nyāya, refer to it as to their standard in logic, and deem its study necessary for the purpose of giving a firm basis to their reasoning.

* Vid. Colebrooke's *Miscell. Essays*, Vol. i. p. 261.

† The view above given, was based upon the Sūtras of Gautama, without a reference to a work of the Vaisēshika school. I have since compared the Sūtras of Kaṇāda and found my view completely confirmed.

It is indeed one of the principal merits of the Nyāya, that its progress is marked by an admirably exact division of the topics, treated in it, and in this respect it is not only superior to all other systems of the Hindus, but even modern philosophy might, with advantage, study it on account of its clearness and exactness. Though none of its investigations has been carried on to a satisfactory end, the Nyāya has, with the means at its command, fully described the circle within which it moved. We must at the same time admit, that notwithstanding its exactness, there is one inherent fault in its exposition, viz. the neglect of all analytical method, a fault of all systems of the Hindus, which has, perhaps, more than any thing else, contributed to the narrow limits of their mental horizon. This fault, which, however, it shares with many other expositions of philosophy; for instance, to mention a celebrated name, with Spinoza's system, is rather a fault of exposition than of the system itself; for no synthesis (in science) is possible without analysis, and having well understood the leading notions of a system, we can easily trace the analytical way by which they were obtained. This apparent absence of analysis in the construction of the philosophical systems of the Hindus is the reason why so many enquirers have done injustice to their philosophical talent. For want of a clear analysis, unable to understand the aphorisms of the Hindu schools, composed in a language in form as well as in thought, foreign to them, they thought the philosophical productions of many centuries and of an ingenious people, a web of either abstruse or puerile notions. On a closer examination we shall come to a juster opinion of them, and although we find a limit as well in the range as the depth of their enquiries, we shall come to place them among the nations which advanced the intellectual progress of mankind.

That Hindu philosophy will, however, have any great influence upon the development of European philosophy and mediately of European civilization, must be denied. Why should this be the case? Although we must admit, that the philosophical researches of the Hindus are as worthy of attention as those of the Greeks, still it is at the first glance evident, that the philosophical works of the former are unfit to be transferred to another soil, while those of the latter will have always the same influence upon every rising generation in every clime and age. This difference lies not so much in the development of the system

Introduction.

as in the form. You are compelled to think by reading the works of the Greeks, they introduce you into the process of their thoughts, and by this force you to accompany them with your own thoughts, until you arrive as it were by your own mind at the principles of their systems, from which point it is easy either to look back upon the way you have made or to advance further. The Hindus, on the other hand, are dogmatical. They commence synthetically with a statement of their principles, yet do not condescend to unfold the train of thought which has led to them. Hence it is impossible for any one to understand their writings who has not previously, to a considerable degree, been practised in philosophical enquiries. The punishment however of this mystery and exclusion is the want of interest, felt in the study of their writings. The same doctrines which might have been instrumental in enlightening thousands, are now forgotten, or in the possession of a few who are hardly able to comprehend them.

Among the general metaphysical notions, the notion of substance is the most important one, as upon it all other notions are either founded or are closely connected with it, and whatever may be the solution of all other metaphysical problems, it must be influenced by the notion of substance.

Substances are, according to the Nyāya, the substrata of qualities and actions,* a definition, which is the right one, as *the basis of further investigation*—it is the right one, because founded on experience. Substance, we add, is in so far the substratum of qualities and actions, as the existence of qualities and actions depends upon the existence of substance; if quality were independent of another, it could not represent another, whose quality it is. The existence of substance must therefore be absolute, that is to say, not dependent upon the existence of another; for in this case, it would be comprehended, not by the notion of substance, but by that of quality. And consequently, to think the idea of substance by any notions including dependance, is a contradiction. This contradiction (of comprehending substance under the notion of quality, and therefore of dependance) was committed by the Nyāya by the distinction between eternal and non-eternal substances, because the

* Or rather of qualities alone according to the modern school of the Nyāya. The definition, that substances are the substrata of qualities and actions, belongs to Kanāda.

existence of the latter is not independent. In the notion of eternal substance, however, the true notion of substance is included, which is to be independent of time and cause.

Another question is, how a substance is united with its qualities? That a substance should have qualities, appears a matter of course, and to question it, shows a vast progress in metaphysical thinking. Although the Nyāya entered not expressly into the discussion of this subject, it must have felt its weight, as they found it necessary to invent a contrivance for such a connexion. A substance is, according to them, united with its qualities by a relation, called intimate relation, which is something real, and is neither in substances, nor qualities, nor actions. We do not intend here to analyze this notion any further (stating, however, that the difficulty is not really removed by it,*) but we turn to a third point in the notion of substance. Substance, according to the Nyāya, is not only united with its qualities by the relation, just mentioned, but all substances are united with the general notion of substance, and single substances in the same way with the notion of their own class. This general notion is rather a common property; for it does exist, independent of the mind which may conceive it, in the substances (also in qualities and actions) themselves, and is even eternal in eternal substances, not eternal in transient substances. This notion exactly corresponds with that of the so-called realists among the scholastic philosophers, who maintained the reality of general notions. Duns Scotus, for instance, asserted, that general properties (notions) were not only in objects *potentia*, but *acta*, and that generality was not only formed by the understanding, but that it existed previously to the mental conception *per se* as a reality, viz., the quiddity itself, which was

* For if it is necessary, that qualities require some link to unite them with substances, it is also necessary, that this link should be united with them by a similar link, and so on. The difficulty, as regards the connection of qualities, is briefly stated, thus. The existence of qualities is dependent upon the existence of the substance, whose qualities they are, but not vice versa. Substance in accordance to its notion, is independent of qualities. Substance therefore is something of itself, and also something on which qualities are dependent, and in this latter respect it is not substance, which is to be independent of qualities. That is to say, the notion of substance in this form is contradictory, and should be abandoned for a notion which is consistent.

indifferent to general or individual existence. A cause, however, was required to remove this indifference, viz. another more extensive quiddity, closely united with the first, and with the principle of individity. (afterwards called *haecceity*.)*

In one point the Nyāya went a step in advance of most of the ancient systems of philosophy, viz., in its assumption, that the special qualities of substances are effects; for instance earth is the intimate (or material) cause of smell, the soul of knowledge, &c. They were no doubt urged to this assumption by the contradiction, which arises, if beside substance, a quality which is necessary and therefore belongs to the quale of the substance, is admitted. If quality is an effect of substance, its existence is evidently derived, and the contradiction removed. Although, however, this hypothesis is a step in advance, it is not the complete solution of the difficulty; for here again the question will arise, how it is possible, that a substance can become a cause, that is, produce something, which is foreign to itself.

Substances, as before said, according to the Nyāya, are either eternal or non-eternal. Eternal are space, time, ether, soul, and the atoms of mind, earth, water, fire, and air. Non-eternal are all compounds, or the things which we actually perceive, and which must have a cause of their existence. Thus substances are divided into those which are without cause, and those which have a cause.

There are three causes;—1. The cause of intimate relation, or material cause, as yarn is the material cause of cloth;—2. The proximate cause, or the actual union of the parts which are to form a compound;—and 3. The instrumental cause, viz. the cause by which this union is effected.

This is similar to the doctrine of Aristotle, who admitted four causes; a material cause, a moving cause, a formal cause, and an end cause. The instrumental cause includes Aristotle's formal, moving, and end causes.

The notion of causality is certainly well considered, and infinitely superior to the notions which other Indian systems formed of it; for there are already made some steps in advance towards the proper discussion of this notion, if a difference in causes is acknowledged. In the enumeration of causes—the cause of motion appears to have been omitted; it is,

* Vid. Tennemann's *Geschichte der Philosophie*, Vierte Aufl. p. 256.

however, contained in the notion of instrumental causality. All activity according to the Nyáya is limited to motion, acts of the mind being considered by them as qualities, and as all actions abide in substances, we must think every substance as a cause of motion (viz. the last cause). They did not, however, discuss, whether motion was necessary to all substances, or only to some or to one, that is to say, whether there is a *primum mobile* or not; they did not discuss the question, whether or not different motions require different causes; nor did they lastly enter into an explanation of the notion itself.* They appear in fact not to have been aware of the intrinsic difficulties of the idea of causality, which undoubtedly is one of the most difficult metaphysical notions.† The contradictions in the notion of cause and effect appear with special force to apply to such causes, by which a change in the qualities of a substance is effected, as chemical, animal, and psychical effects. Such effects are, however, denied by the Nyáya. Material causes must be understood as only the substrata, or the materials for a new union, as for instance, the two halves from which a pot is produced, are the material cause of the pot. There are therefore no real changes, but only changes of the accidental form, which substances may assume in their connexion with others; and there should not be changes at all we add. Every compound substance, according to the Nyáya, is ultimately produced from simple substances. Simple substances, however, are eternal, and all their qualities are also eternal. If this is the case, there is also

* The contradictions which Zeno found in the idea of motion, are well known, and without fully acknowledging their weight, it is impossible to obtain a correct notion of it. Aristotle was well aware of this, and endeavoured to remove Zeno's objections to this notion. How important it is, correctly to define this notion, is evident even from the influence, which it exercised on the Nyáya, where motion is considered as an act, and even as the only act.

† Vide SEXT. EMP. Adv. mathem. in Ritter's History of Philos. Vol. iv. p. 339. That cause could not be later than effect, is evident; but also the effect cannot be later than the cause; for if so, the cause, being antecedent to the effect, would be without effect, and a cause without effect, is a contradiction. And if the effect would be consequent to the cause, it would be, when the cause is no more, therefore an effect without cause. Both therefore must be necessarily together. If this be conceded, then there is the difficulty, why the one more than the other is producing (or cause). These are only part of the difficulties, and without solving them, the objections made against causality, are quite just.

no change of qualities in any compound substances, because by any connexion between them, different from an accidental relation, they would assume changes, contradictory to the notion, under which they are conceived. As the Nyáya, however, admits an actual change in compound substances, in which qualities, not to be met with in the simple substances, are produced, and moreover admits a compound, in which there is a comparatively firm connexion of the parts with each other, it has deviated from its notion of causality, and is hence guilty of the contradiction which it first endeavoured to escape. Notwithstanding these deficiencies of the Nyáya, we still maintain, that it approached nearer than any other Hindu system, to the true notion of causality, causality being, according to Pantheistic, not less than to skeptical idea, a product of habit in the association of our ideas.

In passing from the general metaphysical (ontological) to more special investigations (comprehending natural philosophy and psychology), we may first observe, that the same clearness obtains in the latter as in the former. Existence, or rather that which exists (*το ὄντος ὄν*), in its connexion with material and immaterial phenomena, is much more distinctly conceived than in other systems of the Hindus. We find indeed the same material elements as in the latter; viz., earth, water, light, air, and ether, and also the same qualities; but while in all others they are only generally described, here there is made an attempt to explain the special phenomena as well as the sources of our perception of them, or in one word, we find here the basis of observation, and of the first lineaments of the consequent reflection upon the results of that observation. We meet here also with the first remarks about space and time, and even with some correct notions of their nature, and although both of them are placed among the substances, we must not forget the intrinsic difficulties of this subject, which in our times only has been more satisfactorily investigated by Kant, Fichte, and Herbart. The error of considering space and time as substances, is a consequence of the notion the Nyáya had formed of substance, viz. as the substrate of qualities and actions. This idea would, indeed, have been correct, had the notion of existence been preserved. The Védānta certainly had a much more exact idea of existence, maintaining, that which exists (*το ὄντος ὄν*) must be simply existent, without any attribute whatever, and should strictly not be even considered by a plurality of notions. The Védānta,

however, by denying the reality of phenomena, had nothing to explain, while the Nyáya, retaining the crude notions, given by observation, had no principles whereby to explain them. The most interesting point in this part of the system is the investigation into the nature of matter, an investigation which was indeed entered into by other Hindu systems, yet not with the same success. The Védánta, for instance, reduced the objects of the senses, or the things composed of the gross elements, to elements which are finer and imperceptible to the senses, undoubtedly for the same reasons as the Nyáya, viz. because the origin, the changes, and the destruction of the material things compelled the mind to fix the notion of existence upon some other natures, not affected by those conditions. But according to the Védánta, the simpler elements are only simple, because they are unmixed with others. As regards space, however, no reduction was made, and their view on this point is very like the doctrine of Anaxagoras, who also started from an original identity of the elements with space. The Védánta indeed did not confine its thoughts to those elements, but proceeded to the supposition of a substance, in which there is no difference whatever, but for what reason this supposition was here made, it would be difficult to give a satisfactory reply, and as regards the principal point, space filled out by matter, it was not even touched upon. The Nyáya, on the other hand has examined matter under this point of view, and arrived at the theory of atoms,* in the same way as Leucippus and Democritus. It proceeded even further. With Leucippus and Democritus atoms have some, though imperceptible, extent, and also different figures and mo-

* It is astonishing, that the Nyáyaikas made the supposition of such a substance as the ether, which, like space and time, is pervading and infinite. It is not space itself, but a kind of matter, filling out space, and can therefore be distinguished from it merely by a less degree of density. If so, the consequence should have been, that it was also composed of parts, the last elements of which are atoms. Instead of this, ether is some thing analogous to space, by its being infinite, and yet filling out an infinite space. In fact it appears, they assumed this notion of ether only historically, or as a part of the views on matter which had been formed previously to them. The doctrine of the five elements (ether, air, fire, water and earth) is one of the most ancient hypotheses of Indian philosophy. It is taught already in the Upanishads, and probably more ancient even than the doctrine of the soul. Hence it passed over into the different systems, viz. the Védánta, Sāṅkhya and Nyáya, modified according to the different views they held of substance.

tions, while the Nyáya held them to be absolute units of space, without any dimensions and motions, that is, mathematical points as regards space. They are eternal and unchangeable, and while they are without cause themselves, they are the cause of the material universe. They are imperceptible to the senses, and the knowledge of them is obtained by inference.

The system of Democritus is throughout a crude materialism. The last elements of existence are with him atoms which have no qualities whatever beside form and motion. The soul itself is merely a compound of round atoms, and a deity is of course impossible. A theory of atoms of such a kind is contradictory in its principle, and in its results leads to an annihilation of truth in general. The Nyáya is vastly superior to Democritus' theory; for atoms are first conceived in their real notion as units of matter without any extent, and secondly the theory of atoms forms only a subordinate part of their researches.

The same clearness and to a certain degree comprehensiveness is met with in their psychological enquiries. The faculties of the soul and its relations to the material things and other objects of knowledge, are methodically described. The Nyáya draws a marked line between matter and spirit, by distinctly stating the notions, under which either is perceived.

The soul has, according to the Nyáya, qualities, opposite to the qualities of the substances perceived by the senses, and is therefore distinct from these substances, that is to say, as regards special qualities; for as to qualities, ascribed to substances as far as they are substances, both must of course agree. Qualities of the soul are the emotions and desires, volition and aversion, &c. and knowledge. Knowledge is produced by intellect, which is one of the qualities (faculties) of the soul. Intellect is again fourfold, it is perception, inference, analogy and verbal knowledge. Perception (viz. perception generally, as well of external as of internal objects), is the source from which all other knowledge flows, or rather, without objects of perception the other faculties of intellect have no materials to work upon. All knowledge, that is perceived, is perceived through a medium, through an instrument, by which the soul is in communion either with objects from without or from within itself. External objects are perceived through five external senses, these being in contact with the mind, while internal objects, and

by them the soul, are only perceived through the mind. The doctrine of the communication of the soul with external objects is very curious and interesting, not only because it is original, but because it shows a remarkable acuteness in overcoming difficulties, met with in every system, which considers substances not only as individual beings, but also as a common essence that exists, although dependent upon the individual substances. To perceive individual external substances, and their properties in common with others, it is necessary that the intercourse of the senses with the external objects should take place accordingly, that is to say, that individual substances should be perceived by the connexion of the senses with these individual substances, and the common properties by the connexion of the senses with these common properties. Substances are then perceived in their different relations, viz. first, in the relation of this individual substance and this individual quality, or of this individual substance and this individual act; further, in the relation, which this individual substance has with its class (general essence) or with its generality; and lastly, in the relation, which this individual quality or this individual act of this individual substance has with its class or generality.

This, however, is not sufficient; for a full comprehension, there are required also *general notions*, corresponding with those relations. A tree for instance would not be perceived, without the general notion of a tree, by which a tree at any place and at any time is perceived. This general notion requires again a kind of special knowledge, by which the general notion of a tree is referred to a certain tree. This kind of knowledge, though corresponding with the relations of all substances, which have both general and special properties, and though (implicitly) contained in every object of perception, still differs from the general properties of the things. It is a conception of the soul, produced by its own activity. This knowledge then is internal perception, that is to say, it is not produced by inference, or analogy, or verbal communication, but it is immediate and complete, as all knowledge by perception. Every perception of external objects then, according to this exposition, is based upon two elements, an external and an internal, or as these expressions do not exactly represent their notions, an immediate and mediate, an objective and ideal knowledge. In the same way are the objects of the soul perceived, viz. its different qualities, as aversion,

volition, &c. are called. Though the soul is the object of the mind, it is not directly perceived by it, but is inferred from its qualities. • It is not necessary here to explain the other faculties of intellect, viz. inference, comparison, and verbal communication, as they are discussed in another part of this paper. We here only add, that they must be considered as parts of the quality of knowledge, or, as we would express it, as modified operations of one and the same activity of the soul.

The mind, by which all knowledge is perceived, is not a quality or faculty of the soul itself, but an independent substance, atomic in its nature.* Hence only a single perception or idea is at one time perceived by the soul.

The soul itself is eternal, and therefore so also are its qualities, we should say, also its knowledge, although this knowledge be not perceived by the soul itself. It is at the same time every where, not, however, as an infinite soul, as the universal soul of the Védānta, where all things constitute the pervading soul, be it even a piece of matter, though bound by ignorance to a state of apparent material existence, but in the same way as space and time are connected with every thing. There is a general soul, and there are individual souls. The general soul has the same qualities with the individual souls, with the exception of aversion, pleasure, pain, merit and demerit, because these qualities would involve imperfections. The individual soul is subject to the law of transmigration, and happiness and misery are the consequences of its good or bad actions. It is, however, possible for the individual soul to emerge from the vicissitudes of worldly existence by the attainment of true knowledge.

Here it is necessary to point out what place the notion of the general soul or the deity (Īśvara, the Ruler) holds in the system of the Nyāya.

The Védānta denies a personal deity. There is a supreme soul, but this soul is all in all, individual souls are emanations from it, as sparks from fire, and are essentially identical with it. Nature in its first elements as well as in its development depends upon it. The

* How is mind united with the soul? Not by any act of either; for they are independent of each other. They are united by something without them, viz. by the power of God, in the same way, as atoms are united with each other; for these latter, although the material causes of compound substances, are not causes of their connexion.

Védānta in fact destroys the distinctions between God and nature; every distinction is delusion, and there is nothing but one all-pervading, knowing and blissful being, and even such distinctions as of existence, knowledge, bliss, are not real distinctions, they are but contrivances to approach to the true idea of the One.—If there is nothing but existence, but knowledge, but truth, there should be no difference whatever, and least of all any delusion, on the contrary, there is with man almost nothing but delusion; only few approach the true notion of God, and but inadequately; in most men there is only difference found, and nature is altogether opposed to it. Nay, this is not only the case in the last emanation of this deity, but if we comprehend nature in its principle, where all differences of substance, quality, form, &c. disappear, if we comprehend it as dependent upon the soul, it is ignorance, that is to say, indiscrete matter, it is non-existence, non-knowledge, &c. but this, Proteus-like being, of which it cannot be said, that it exists, nor, that it does not exist, is to be placed upon the soul, to be understood by it. This is to say: in theory the Védānta acknowledges but one principle, the infinite soul, in fact, however, two, soul and non-soul, ignorance or matter.

With reference to God, the Sāṅkhya is divided into two sects, the theistical and the atheistical.*

* Col. M. E. pp. 251-2. God, Iśvara, the supreme ruler according to Pātaṅjali, is a soul or spirit distinct from other souls, unaffected by the ills with which they are beset, unconcerned with good or bad deeds and their consequences, and with fancies or passing thoughts. In him is the utmost omniscience. He is the instructor of the earliest beings that have a beginning (the deities of mythology) himself infinite, unlimited by time.

Kapila, on the other hand, denies an Iśvara, ruler of the world by volition, alleging, that there is no proof of God's existence, unperceived by the senses, not inferred from reasoning, nor yet revealed. He acknowledges, indeed, a being issuing from nature, who is intelligence absolute, source of all individual intelligences and origin of other existences successively evolved and developed. He expressly affirms, that the truth of such an Iśvara is demonstrated, the Creator of worlds, in such sense of creation; for "the existence of effects," he says, "is dependent upon consciousness, not upon Iśvara," and, "all else is from the great principle." Yet, that being is finite, having a beginning and an end, dating from the grand development of the universe, to terminate with the consummation of all things. But an infinite being, creator and guider of the universe by volition, Kapila positively denies.

See also Wilson's Sāṅkhya Kārika, pp. 166 to 168.

Kapila denied altogether a deity; the *Iswara* whom he admits, is only a finite being; for although he assumes a being, whose intelligence is absolute, yet this being issues from nature, and is again to terminate in nature. It is very much to be regretted, that of Pātanjali's doctrine nothing as yet has been published. It is difficult to form an exact idea of his being from the words, quoted by Colebrooke. According to them he has some attributes of the deity; he is of the utmost omniscience, infinite, unlimited by time; but how he is connected with the creation and ruling of the universe, it is impossible to conceive. If his doctrine in other points agrees with the atheistical *Sāṅkhya*, all the development of the world in its different forms is independent of him; for it is the necessity of nature, that certain emanations are issuing from it, and returning to it after certain periods. It would rather appear, that he is a kind of Epicurean deity, blissful in himself and unconcerned with the affairs of the world.

The *Nyāya* is essentially theistical. According to them, God is personal. He is not, as it expressly asserts; mere existence, mere knowledge, mere bliss, but he is a substance, of which existence, &c. are attributes; for it is impossible to think of existence, knowledge, &c., without referring them to a subject which exists, which has knowledge, &c. He is not the supreme soul of the *Vedānta* which is the whole universe, but distinguished as well from the world as from finite spirits. He is not a mere emanation from nature, as Kapila asserted, but altogether different from nature, and self-existent. He is also not, as appears to be Pātanjali's opinion, a merely omniscient being; but he is of infinite power, the Ruler of the universe, and nature could not exist independent of a God, or could exist only without order, harmony and object. And this idea is not only a fortuitous addition to the system, but one of its chief springs; for all the substances in the world, without God, remain unconnected. There may be atoms, but they do not constitute a world, they are solitary, unconnected, without any apparent difference; of themselves they have no action, produce no effects, and not even the simplest compound of two atoms can arise from them alone, much less a compound of a certain form and for certain objects, not the world in its unity, harmony, and infinite variety of forms. There may be souls, independent of a creator, but without conscience, without enjoyment, without development and without a final end, for

they are not united with mind, the instrument, by which they are connected with the world, among themselves and with the creator. Because this connexion exists, because there is form, because individual souls have conscience, therefore it is necessary to assume a God who by his infinite power and knowledge is the author of this connexion, of the all-pervading harmony of the world. This argument for the existence of a deity is essentially teleological or based upon final causes in nature. The deity is the creator of the world as to its form, not as to its matter.

The Nyáya approaches most closely of all Hindu systems the Christian notion of God, as its deity is an infinite spirit and at the same time personal, as it is wholly distinct from matter, and the creator and ruler of the universe.

It would be superfluous to point out the marked distinction, drawn here between body and soul. Though a higher development of philosophy may destroy the distinctions between soul and matter, that is, may recognise matter, or what is perceived as matter, as the same with the soul (as for instance, Leibnitz did), it is nevertheless certain, that no true knowledge of the soul is possible, without first drawing a most decided line of demarcation between the phenomena of matter and of the soul. In the Nyáya there is even an approximation to the doctrine, that soul and matter are as to their principles one and the same, viz. in the theory of atoms, according to which atoms are the negation of space. From this notion we may draw the inference, which has not been drawn by the Nyáya, it is true, but which would have been only a necessary consequence from the premises, that matter, being a compound of atoms, is only a phenomenon, as regards its extension through space. Where then is here shown the difference between the soul and the true substratum of matter? Let us see then, what is the soul? The soul is different from matter, as this last is perceived by the senses as extended through space. This distinction is true, but further to conclude, that the soul is also different from matter in its real nature, where matter is not extended, is certainly hasty, and does not follow from the premises. What then is the soul according to them? It is all-pervading, infinite, like ether, space and time. This answer, though far from satisfactory, shows, that they felt the difficulty in determining the notion of the soul, when their other notions had undergone a decided alteration.—The most peculiar notion in their psychological theory is the existence of

of the mind independent of soul, although most intimately connected with it; for through the mind only the soul perceives, as well its own qualities, as the qualities of external substances. How could the Nyāya have made a supposition in which the contradiction is so evident? For it is easy to conclude, that if the mind is independent, its perception is also independent. If the mind perceives, this perception is not in the soul, and if this perception is in the soul, it is not perceived. The soul then has knowledge, which is not real knowledge, because not perceived, and the mind has no knowledge, though it perceives.*

We may solve this difficulty at least in some way. The mind was first undoubtedly considered as an internal sense according to the analogy of external senses, in order that there be a unity of perception, and that, as the external objects are perceived through different media, the objects of the soul be perceived through an analogous internal medium, a supposition, which has also been made in modern (English) philosophy. So far the Nyāya might have considered the mind as an internal sense, but they met with a difficulty, which was not felt in the same intensity by modern philosophers. If knowledge be perceived by the soul through the medium of the mind (the internal sense), why is it not always present in the mind? why does it disappear and give place to other objects of perception, etc.? Locke was surprised at the narrowness of the human mind, without being able to account for it; the Nyāya in endeavouring to account for it, invented an independent substance, the mind, which is an atom, and according to its atomic nature only able to represent or to perceive one object at one and the same time.

This, I think, is the solution of the difficulty, and though it is certainly only an evasion, because its supposition creates greater difficulties than the former one, it still gives evidence of a spirit of enquiry in the school.

In comparing the psychological theory of the Nyāya with more modern doctrines (with the exception of the latest period) we must admit, that in a metaphysical point of view there is no great difference between them. The same objections are to be made to either, the doctrine of faculties being involved in the same contradictions as that of qualities. In either case, if you are to explain, what the soul is, you have to state, what it is, independent of its qualities or faculties, and

also to enumerate the latter. Your explanation will thus point out a quality, which is not a unity, but something defined by a variety of notions. This, however, is not the place to discuss the matter, and we wished only to remind the reader, that modern philosophy in this respect cannot boast to have advanced one single step beyond that of the Hindus, that is to say, in the metaphysic of the soul, although it would be absurd to deny, that modern psychology, as to the observation of psychical phenomena, has made rapid strides towards perfection.

In passing over to the strictly logical enquiries of the Nyáya, we have to premise, that we cannot view them with the same satisfaction, and although we may make ample allowance for the different forms of language, in which they are explained, we are compelled to confess, that they are neither exact nor complete.

The Nyáya has treated the logical topics in the inverse order of that adopted by us, viz. first inference, then ideas, and lastly propositions. This order is followed, not in consequence of a different method of arrangement, but in consequence of the subjects being based upon different grounds, and flowing from different sources. Logic might undoubtedly be treated analytically and commence with the exposition of syllogistical forms. Considering argument as a fact, we might analyse various arguments, and proceeding to their elements, that is to propositions, gradually arrive at ideas or notions. But the Nyáya, far from following such an analytical course, holds inference to be a quality (or modification of a quality); different from the quality of forming names and notions, and discusses inference before verbal knowledge, evidently with the purpose of showing, that the latter in some way depends upon the former.

We, however, treat these doctrines in their common order, with no other intention than to make ourselves better understood.

Verbal knowledge is one of the divisions of intellect. The first act or the first condition of understanding words, is the forming of the name! A name is corresponding to a certain object, and this object is connected with the name by the power of the name. A name which has such a power, is a word. The clear and distinct knowledge of what is implied in a word, is produced by a third act, and is the meaning of a word. This latter is in fact identical with idea or notion, as is evident from the examples given, as for instance, a tree is a thing which has root, stem, branches, leaves, etc.

Here again is the order perverted, the name is certainly not the first operation, and the object to be named, the second, but just the reverse. There must be objects to be named, and though we may admit, that the clear idea of a subject often succeeds a name, still the object, of which the notion is formed, is the first, and we must assert, that what precedes the notion, also precedes the name.

The enquiry, how ideas are formed from a variety of similar objects, belongs to psychology, and however interesting this question otherwise may be, logic has nothing to do with the psychical process, by which ideas are produced. If this were the case, we might still have to wait for a logic, as a psychological theory has not yet been established to general satisfaction, while logic as a science has been complete for more than two thousand years. By the considering first of the names and afterwards of the corresponding notions, the real character of a notion has been at least obscured. From the given examples we see, that a notion, instead of being defined by the genus, under which it is contained, and the specific difference, is explained by a genus, which is distant from it by a number of intervening notions (for instance, genus of tree = thing) and by a specific difference, which besides its own difference, enumerates properties which it partakes with others (for instance root, stem, leaves, etc. = specific difference).

The meaning of a word or idea, ought to have been considered in its connexion with other ideas, as made up by genus and differentia specifica, and as excluded from them by their compatible, contrary, and contradictory opposition. Here, however, are genus and species raised to categories under the names of generality and particularity, being there the common properties of substances, qualities, and acts, while the opposition of ideas or terms is treated in the seventh category, that of negation. Negation is the category which arises, if the categories are mutually denied of each other. It is the mutual difference of the categories and therefore the same with logical opposition. Negation is again of four kinds, mutual negation, antecedent negation, (negation of a thing, that is to be,) emergent negation (destruction) and absolute negation. Of them antecedent and emergent negations are not logical, but metaphysical negations, viz. the relations which a thing may have with regard to its origin or cessation in time. Mutual negation corresponds to contrary opposition (*oppositio contraria*) of terms. For instance

black is the negation of white, of red, &c. and *vice versa*; here the one is not denied in an absolute, but in a relative manner. Absolute negation* would correspond to contradictory opposition (*oppositio contradictoria*) as is evident from an allusion to it in the explanation of a negative inference. Here it is said, that a notion is the negation of its absolute non-existence, for instance cloth is the negation of its absolute non-existence, non-cloth, or $A = \text{Non—Non—} A$, that is to say, A is the negation of what is in contradictory opposition to A .

From this arrangement then did not only result an imperfect exposition of the logical relations among ideas, but an important metaphysical error, by which logical relations of ideas are considered as real properties of substances.

In finding the logical treatment of notions by no means satisfactory, we may at the same time observe, that there are many valuable remarks on some psychological and grammatical relations of ideas which we do not recollect to have found elsewhere. These we have given in a note to the text, where this subject is explained.

A proposition to convey a distinct meaning, must, according to the Nyāya, have four qualities :

1. Contiguity, which, according to some, is the uninterrupted succession of the words pronounced in a sentence, so that for instance, the first word of it be not pronounced in the present moment, and the next half an hour afterwards, according to others, the arrangement of the words according to their grammatical connexion, for instance, that a preposition be placed together with the word which depends upon it, and not with a word, to which it does not refer.

2. Consistency, or the mutual agreement of the words, according to their sense, so that contradictory terms be not connected.

3. Structure, or the grammatical (terminations) form of the words, which correspond in their meanings (for instance, that the verb agrees with the subject in number and person.)

* There is a difference of opinion in the Nyāya with reference to absolute negation. Some appear to conceive it merely as a negation of present existence, others as the negation of a contradictory notion. In this last sense Colebrooke understood it, (*Mis. Essays*, Vol. I. p. 288,) and this is also the interpretation of the Mīmāṃsā. (Wilson's *Sāṅkhya Karika*, p. 19.) That the author of the *Bhāṣya Paricchēda* adopted also this sense, appears to me evident from the above explanation.

4. Intention, that is, the meaning which the speaker wishes to convey by a sentence.

There again the logical characteristics of a proposition have been omitted, as all those points, with the exception perhaps of consistency, belong to the grammatical structure of a sentence.

The logical explanation of propositions, as a matter of course, passes over any grammatical form a proposition may assume; it treats only of the relation between two ideas, and its simple question is, whether two ideas can be connected or not.

It is evident, that in this way neither quantity, nor modality of propositions could have been discovered. We might, however, dispense with them, as these forms are not strictly logical; but not even the division of propositions according to their quality has been made by the Nyāya.

The theory of ideas and propositions is the weakest point in the logic of the Nyāya; they are more successful in explaining the form of arguments; for though the theory of syllogism is far from exact and complete, we must admit, that they understood the general character of a syllogism.

According to Gautama a complete syllogism contains five members (Avayava = proposition). 1. The proposition (pratijnā, that which is to be proved by the argument). 2. The reason, argument (hētu). 3. The instance (Udaharana, drishtanta). 4. The application (upanaya). 5. The conclusion (nigamana), for instance:

1. This hill is fiery,
2. For it smokes,
3. What smokes is fiery, as for instance, a culinary hearth.
4. This hill smokes,
5. Therefore it is fiery..

The modern school of the Nyāya reduced the syllogism to three, and even to two members, and this last reduction appears to have been most generally adopted,* as it is in the Tarka Sangraha and Bhāṣha

* Colebrooke (Mis. Essays, Vol. I. p. 292), adverted only to Gautama's Sūtras, and not to a more modern work of the Nyāya, when he asserted, that the regular syllogism of the Nyāya consisted of five members. The modern school of the Nyāya (vide Dr. Ballantyne's Lectures on the Tarka Sangraha, p. 31), declares the five membered form rhetorical in distinction from its logical form, which contains only two members. Dr. Ballantyne has clearly pointed this out in his treatise.

Paricchéda. In this form the two premises, viz. major and minor propositions are condensed into one premise, of which we shall now give a description.

That a syllogism be correct, two things are required. 1, a general proposition, in which the subject (reason) is invariably connected with a predicate (conclusion), more comprehensive than the subject, and 2, a minor term, with which the subject of the general proposition is connected. That there is this double connexion of the minor term with the reason, and of the reason with the conclusion, is to be decided by consideration, which is the intercourse between the minor term and the reason, as connected with the general predicate or the predicate of the conclusion. This consideration is only one, and therefore the form of the antecedent of the conclusion can only be one, or : there is only one premise, by which the minor term is expressed as determined by the reason in its invariable connexion with the conclusion.

For instance : let a man from former observation know, that smoke is invariably connected with fire, as for instance on a culinary hearth ;

use on the Nyáya system, and also in his Lectures on the Nyáya philosophy. He says, (Nyáya system of philosophy, p. 5.)

" Now, in this form of the syllogism (which we do not find alluded to in Mr. Colebrooke's essay), there is neither more nor less than there is in the Aristotelic syllogism. The wonder would be if there had been. The first formal difference observable is, the wrapping up of the premises in one logical datum. The reason for preferring to regard these as two inseparable members of a single statement appears to have been this, that it is only when simultaneously present to the mind, that the premises suggest the inference, and this simultaneousness of cognizance is secured by combining the two assertions in a period, or sentence, of which the whole becomes intelligible only when the last word in it has been uttered.... If we separate the two members of the original datum in the example above cited, we obtain the following :

Whatever smokes, is fiery ;
The hill smokes,
Therefore the hill is fiery ;"

and p. 9. " To return to our text-book. The author tells us, that a man, after having, to the satisfaction of his own mind, inferred the presence of fire from the perception of smoke, may wish to impart his conviction to another. In other words having ascertained the truth as a logician, he may wish as a rhetorician, to establish it to the satisfaction of somebody else. Here we step distinctly out of the province of logic, and enter that of rhetoric."

let him see afterwards an uninterrupted column of smoke rising from a hill, he will recollect the general proposition, that smoke is invariably connected with fire. Hence the knowledge arises: This hill is possessed of smoke, which is invariably connected with fire. This knowledge, this one act, by which there is a progress from one object to a third by a second, is consideration, from which the conclusion arises: This hill is fiery.

This is in its principal points the theory of the Nyáya of the form of the syllogism. It is essentially the same with that of Aristotle. The differences are two. The first is a difference in the form, or rather in expression, viz. that the two premises are combined into one. The exposition is certainly not simple, for the different combination of the ideas, forming a syllogism, ought to be represented in their natural form, which is the connexion of two in a proposition, and the same principle ought to have been applied to the conclusion; for if it is true that two premises must be combined into one, the conclusion also should not be stated in a separate sentence, but the whole syllogism should form one sentence, for instance, in the example: This hill, determined by smoke, which is determined by fire, is determined by fire. Yet the difference is only apparent; for the Nyáya, as Aristotle, connects one notion with the other through a third with which the latter is connected, or excludes it by a third, from which the second is excluded.

The second difference is, that the Nyáya wanted not only to give rules for the correctness of the logical operation in arguing, but to guard against false premises, and for this purpose the consideration was also to establish the truth of the major proposition by a reference to an instance, in which the truth of the preposition was exemplified. Their consideration was therefore not only directed to the logical operation of arguing, but also to the truth which may result from it, and both the truth of the conclusion, and the correctness of the argument should be the result of one and the same operation, which of course is impossible.

With the exposition of the form of syllogism the logical theory of the Nyáya is nearly completed. Gautama divided inference into three kinds; 1, inference of an effect from a cause, as if rain is inferred from a collection of clouds; 2, inference of a cause from an effect, as if rain is concluded from an increase of the water in a river; and 3, inference from general notions, as if earth is inferred to be a substance from its

having the quality of smell.* This division, it is hardly necessary to remark, is not logical, as cause and effect are metaphysical notions and have no relation whatever to the different forms of syllogism. The modern school of the Nyāya has therefore not adopted this division, but acknowledges three kinds of syllogisms; which are: only affirmative inference, only negative inference, and inference, at the same time affirmative and negative. From the examples, given in illustration, it appears, that the latter includes two moods of the first and second figures, Barbara and Camestres; Barbara being the type for all general affirmative conclusions, and Camestres for all general negative ones. Here, however, is their theory finished, and we find no trace of the different moods the syllogistical forms can enter into.

It is a remarkable circumstance, that the general form of syllogism should have been found by the Hindus, and yet that they should not have discovered the different figures and moods, the diversities of which are the result of mere combination. We think, this deficiency, was the consequence of two causes especially,—first, of their technical language, which although precise, is yet cumbrous and not comprehensive, and secondly, of their pious regard for every thing traditional, be it in political institutions, in religion, or in science. The Sūtras, which are the foundations of their systems, have always remained text-books, and any discovery that had been made in theory, did not prompt them to attempt a new exposition of science, but gave only occasion to a new interpretation of the school.

The Bhāsha Paricchēda itself is a work of the modern Nyāya. The author Viswanātha Panchānana Bhaṭṭa, the son of Vidyānivāsa Bhaṭṭa, accompanied the text with a commentary under the title “Siddhānta Muktvāli” (the pearl-wreath of truth), and he is known also by his commentary to Gautama’s Sūtras, which bears the title “Nyāya Sūtra Vrittī.” According to the statement of the Pandits he lived about two hundred years ago. The Bhāsha Paricchēda is a text-book in the schools of the Nyāya in Bengal. There is no Pandit of any repute who does not know it well, and many know the whole of it by heart. And indeed it is admirably adapted for the purpose of introduction into the study of the Nyāya philosophy. It is a succinct exposition of the principal topics of the whole system, and may easily be committed to memory. It is written in the well known Anuṣṭup metre. The style,

however, is not poetical at all, but that of the most sober prose, and nowhere is the attempt made to combine the graces of imagination with philosophical method.

The course, followed in the work, is simple. The author gives first the leading ideas of the system, that is, the most comprehensive metaphysical notions, viz. the notions of substance, quality, action, generality, particularity, intimate relation and negation. He then enumerates the various substances, qualities, actions, &c. and defines the properties common to all categories as well as those common to more or less of them. After this exposition the different substances in their relations to themselves, to other substances and to their qualities and actions are explained. In the same way the author discusses the qualities of substances, and his work is finished, when he has treated on the last quality, enumerated at the commencement of his treatise.

The commentary is in thought and language a very different composition. It is written with the object of supporting the views of the author and of the school in its controversy with other doctrines, and enters therefore frequently into intricate discussions in establishing the fundamental tenets or defending disputed points of the system, and makes use of the whole armory of the sometimes very abstruse technical language of the Nyāya.

This commentary has again been commented upon by Mahādēva Bhaṭṭa, but I received a MS. of his work too late to make any other use of it than to compare it with the text.*

The Sanscrit text of the Bhāṣya Pariccheda was first printed in Bengali characters in 1821, with the addition of a Bengali translation of the text and of the commentary. The translation of the latter, however, is rather, a paraphrase, as the alterations are sometimes considerable.†

* The MS. is in the Library of the Sanscrit College of Calcutta, of which, however, I was for a long time not aware, as it is not mentioned in the list of books in that Library, printed in the Sanscrit Catalogue of the Asiatic Society. It has two titles, "Mahādēva Bhaṭṭa-kṛita Muktāvali Prakāśa:" and the shorter one, "Dinakarī Tīkā." In his introduction, the author mentions also the name of his father, Balakrishna.

† The title is, "A system of Logic, written in Sanscrit, by the Venerable Sage Boodh, and explained in a Sanscrit commentary by the very learned Viswonath Tarkalancar, translated into Bengalee by Kasee Nath Turkopunchanun. Calcutta, 1821.

Another edition of the Sanscrit text together with the commentary, appeared in 1827, under the auspices of the Committee of Public Instruction. The text is correct, but not so the commentary. It is full of mistakes, omissions and interpolations. The interpunctation is either faulty or entirely disregarded, and the numbers of the successive Slokas are not attached to the corresponding portions of the commentary, so that an easy reference of the one to the other is impossible.

The present edition has been carefully revised partly by comparison with Mahádéva Bhaṭṭa's commentary, partly by a reference to the corrections in the copy of Jayanáráyana Tarkapanchánana, the professor of Nyáya in the Sanscrit College, which he had the kindness to lend me, and for which I offer my grateful acknowledgments.

The notes which I have added to the translation, are chiefly given for the purpose to elucidate the principal points of the system of the Nyáya, in accordance with the object of this work to contribute to a fair estimate of the merits of Hindu philosophy, and are therefore more copious in such parts as contain the distinguishing features of the Nyáya, for instance, the ontological portions, the doctrine of atoms, their notion of the deity, and their logical theory. They are less copious in portions which contain their explanation of the differences of matter; for as natural science with the Hindus has hardly made its beginning, their explanation is without any value. I would, however, guard here against the misconstruction, that their failing to explain the phenomena of matter, affected also the correctness of the principles, by which they tried to explain them. Natural science with reference to those phenomena is quite distinct from the philosophical theory for the interpretation of them. Democritus' explanation of natural phenomena may be entirely false, and still his theory of atoms may be correct, (although it is not in our opinion,) which is at least partly borne out by the fact, that in modern chemistry the theory of atoms has been adopted, although no one would admit the application of it which Democritus made for the explanation of the phenomena. The cause of this is a double one; first, philosophy is quite distinct from natural science, the latter being based upon observation and experiments, the former upon the relations which notions have among each other. Secondly, a philosophical system may have obtained the true principles for the explanation of intellectual and material phenomena, but at the same time

not have fully investigated the intermediate notions which may be necessary for explanation. A hasty application of these principles without due regard to such notions and to the results of natural science, is very apt to throw discredit upon the previous researches by which a system arrived at its principles, and also upon philosophy itself.

To mark the more the method of the philosophical discussion of the Nyáya, I have generally preferred to give their interpretation in their own words, and therefore made large extracts from the commentary in as literal a translation as possible, which I hope, will be found also useful to the student of the Nyáya in general, as facilitating the reading of the commentary and the understanding of the technical language of the Nyáya.

DIVISION OF THE CATEGORIES OF THE NYA'YA PHILOSOPHY.

SALUTATION TO GAṆE'SA.

1: To Krishna, radiant like the new cloud, the thief of the clothes of the milkmaids, to him, who is the seed of the tree of the world, be adoration.

2. There are seven categories, ' substance, quality, action, generality, particularity, intimate relation and negation. .

1. Padārtha is explained in verse 13, as that which is object of knowledge, the commentary adds object of proof, of nomination; but as this applies to every idea, the definition is too wide, and ought to have been restricted to the most general objects of knowledge.

I have followed Colebrooke in translating Padārtha with category, although that term somewhat differs from the idea which Aristotle expresses by the same. According to him, categories are the most extensive classes of what is denoted by the simple word (the word in no connexion with another), Cat. 2. τῶν κατὰ μηδεμίαν συμπλοκὴν λεγόμενων ἕκαστον ἥτοι οὐσίαν σημαίνει κ. τ. λ. He enumerates ten, viz. essence (οὐσία), quantity (πόσον), quality (ποιόν), relation (πρός τι), the where (ποῦ), the when (ποτέ), position (κεῖσθαι), to be possessed of (ἔχειν), action (ποιεῖν), and passion (πάσχειν).

Ritter in his history of philosophy (English Transl. Vol. III. p. 66) remarks on them: "If the categories had been put forward as an accurate and exhaustive division of the modes of being, it would be open to many objections, but Aristotle does not usually ascribe much importance to this enumeration of the most general notions, so that we may regard it as nothing more than an attempt to exhibit in a clear

light the signification of words taken absolutely in order to show, how truth and falsehood consist in the right or wrong combination of these elements."

However, as most of Aristotle's categories refer to classes of existence or to what is most nearly related to them, and as in modern philosophy, the term of category expresses almost universally this meaning, we may safely adopt it here, viz. as referring to the notions, which express the general forms of knowledge, or what is the same, the general modes of existence. It will be interesting to compare the categories of the Nyáya with those of Kant, with which they have a curious resemblance.

They are :

1. Quantity.
 - a. Unity.
 - b. Multiplicity.
 - c. Totality.
2. Quality. 3. Relation.
 - a. Reality a. Inherence and subsistence (substantia and accidens).
 - b. Negation. b. Causality and dependence (cause and effect).
 - c. Limitation. c. Community (Mutual causality).
4. Modality.
 - a. Possibility (impossibility).
 - b. Existence (non-existence).
 - c. Necessity (accidentalness).

The categories may be divided, according to the commentary, into two classes : into categories of affirmation, and negation. It was, however, not necessary, expressly to introduce this division in the text ; for, the seventh being the category of negation, it is self-evident, that the six preceding must be categories of negation. The number of seven categories is adopted by the Vaiśeṣhikas, and also acknowledged by the followers of the Nyáya, as established in the Bhāṣhya.

Karṇāda acknowledged only the six first categories, excluding negation. Gautama, the founder of the Nyáya, enumerates under the head of objects of proof (categories) soul, body, sense, object of sense, intellect, mind, activity, fault, condition of the soul after death (transmigration), retribution, pain, deliverance from pain. Two more categories, power and similarity, adopted in the Upamāna Chintamani, are contained in the first six categories, and must therefore be rejected.

3—5. Substances* are earth, water, light, air, ether, time,

2. The definition of substance* is to be the substrate of qualities, and to have substantiality (v. v. 24). To explain this more fully, it is said in the commentary to be the substrate of qualities either in the relation of intimate union (Samavaya Sambandha) or in the relation of antecedent negation (Prāgabdhā) that is of future existence. The latter definition is given to obviate an objection which may be raised from the condition of substances at the time of their production. When substances are produced, they have according to the Nyāya no qualities. If they have no qualities, they are no substances according to the definition, that substances are the substrates of qualities. By the second definition, that they are substrates of qualities either in the relation of intimate union, or of future existence, this objection is removed.

With regard to substantiality or the genus of substance the commentary remarks: If somebody (this is the statement of the Charvākas) would say: There is no proof that substantiality is a genus; for it is not proved by perception, as melted butter or lack (according to your own admission) have no substantiality,—we contradict, because substantiality is proved by the necessity, that there should be some distinguishing attribute of the intimate cause of an effect, or some distinguishing attribute of the intimate cause of the connection and separation (between the parts composing a substance). This argument is founded on the supposition of the Nyāya, that every cause must have some distinguishing attribute (कारणं च किञ्चिदसावच्छिन्नं) under which it is comprehended; it is a cause, because for instance, it has the general attribute of earth, water, &c. Substance therefore, as the cause of qualities, for instance earth of smell, must be conceived by the distinguishing attribute of substantiality. The genus substantiality depends therefore not on perception, but on inference.

Some suppose, continues the commentary, darkness to be also a substance; for, they argue, it is proved by perception, it has colour and action, and is neither earth nor any of the other substances. Its organ is the eye, at the time that it is without light. This argument is not valid;

* Kaṇāda gives the following definition of substance, Vid. Vaiśeṣika Sūtra. 1st Adhyāya. 11th Sūtra. क्रियामुच्यते स्वभाविकारणमिति इत्यस्य च । Substance is the substrate of qualities and actions, and has intimate causality.

Division of the Categories

space, soul and mind; qualities³ are colour, taste, smell, touch, number, quantity, individuality, conjunction, and disjunction, priority, and posteriority, intellect, pleasure, pain, desire, aversion, volition, gravity, fluidity, viscosity, faculty, fate, (merit and demerit) and sound.

6. There are five actions,* throwing upwards, throwing downwards, contracting, expanding and going.

7. Wandering about, evacuating, trickling, flaming upwards, moving crookedly, are included in going.

8. Generality⁵ is considered two-fold, extensive and non-

for, darkness being produced by the absence of light, it is unnecessary to assume the existence of another substance. The supposition of its colour arises from delusion, as does also the supposition, that it has action, viz., from the cessation of light. If darkness were a separate thing, and not included in the category of negation, as gold is included in light, an infinite number⁶ of substances, (viz. in accordance with an infinite number of negations) must be assumed.

3. The definition of quality,* which is given in verse 89, is : Quality is, whose substrate is substance, and which is without quality and action, that is to say, there is no quality of a quality, nor an action of an action, or the notion of quality would be changed to that of substance. The argument, by which it is proved, that quality in a class, is the same as that, which proves the same of substance.

4. Action,† according to the Bengalee translation, is the special category, which in the relation of intimate union is present in a substance which has velocity, or the category, which after a duration of five moments is subject to destruction, viz., at first, there is contact ; 2, Separation ; 3, Destruction of a former connection ; 4, A new connection ; 5, Cessation of the action.

5. *Commentary.*—Generality (or class) is intimate union of many

* Kāṇḍa's definition of quality is : द्रव्यान्वयी गुणवान् संयोगविभागेच्छकारणमन-
पेक्ष इति गुणलक्षणं ॥ A. 1. that is, quality is sited in substance, has quality and
does not depend upon conjunction and separation without cause.

† एक द्रव्यमन्वयं संयोगविभागेच्छकारणमनपेक्षमिति कर्मलक्षणं ॥ A. 1. action is,
whose site is substance alone, which is without quality, and does not depend upon
conjunction and separation without cause.

extensive. Existence, as including substances, qualities and actions, is called extensive.

9. The class which differs from this is called non-extensive; substantiality and similar notions are extensive and non-extensive.

10. By its including many things, it is extensive; by its being included in a more extensive class, it is non-extensive.

in something eternal, or is eternal and the intimate union of many. It is said, "in something eternal," because intimate union of many exists also between things in contact. "Of many," because intimate union in something eternal exists also in such infinite quantities as the sky; "in intimate union," because the existence of many in something eternal refers also to absolute negation. Consequently there is no generality or genus, where only one individual exists, or where there is no difference of individuality, or where there is confusion, or where there is a retrogress in infinitum, or where an idea is changed to its contrary, or where there is no relation. For instance, the sky forms no class on account of its individuality. The notions of a donkey and of an ass (in Sanscrit the terms : बटः and कलसः are selected, either of which means a jar) are no class. The notions of element and form are no class, because the value of these notions is confounded. Generality is no class, because, there is no place of support for it, (it would require a retrogress in infinitum; for if there is a class of a class, or a notion of a notion, there must also be a class of the class of the class and so further) particularity is no class, because it would thus be changed to its contrary. (Particularity by becoming generality would be the contrary of its notion.) Intimate union is no class, because it is not in the relation of intimate union (in the relation of intimate union are only substances, qualities and actions).

According to their definition of class only substance, quality, and action, further the general notion of those three, which is reality, the notions of the substances, with the exception of sky, space and time, the notions of the different qualities and actions as well as the notions which are included in them, form generalities or classes. The other four categories are not classes, but as the Bengalee Translator calls them, Upadhis, titles, general characteristics.

The ultimate condition of eternal substances is called particularity.*

11. The connexion of a substance with its composing parts, as of a jar, &c. with its two halves, &c.; further the connexion of substances with qualities and actions, and *lastly* the connexion of substances, qualities and actions with their respective classes is called intimate relation.†

6. *Comm.*—The ultimate condition of eternal substances is particularity.* The ultimate condition, viz., the condition, which remains ultimately, last after all (according to the Bengalee translation, the condition which remains until the general conflagration of the world), than which there is no further particularity, that is to say, the condition, abiding in one substance only; for in compound substances from a jar down to the union of two atoms there is mutual difference, by means of the difference of all their respective parts; but the mutual difference of atoms is particularity; this is a difference by itself, and a particularity further than this does therefore not exist.

7. *Comm.*—The relation, of parts with things possessed of parts, of generality with single objects, of qualities with things possessed of qualities, of actions with objects possessed of actions, is intimate relation. Intimate relation means constant relation. It is proved by the fact, that the intellect, when determined by qualities and action, is in the relation of what is determining and what is determined (predicate and subject) for it is a determined intellect, as the sentence: The man bears a stick, is the result of a determined intellect. Hence, since in this case neither the relation of contact nor any other relation is possible, intimate relation is proved.

As the Bengalee translation expresses the meaning much more clearly, I have given it here instead of the explanation of the original. Intimate relation, excluding distinctive relation, is constant relation of only one thing which regulates a condition. By the term "constant" the relation of contact is excluded, by the term "excluding distinctive relation," the relation of distinction, by the term "which regulates a con-

*सामान्यविशेष इति बुद्ध्यपेक्षं ॥ A. 1. Both, generality and particularity depend on intellect. The commentator, Sankara Misra adds, "generality is the intellect, which is found in many; particularity, which is separated from others."

12, 13. Negation is two-fold, universal negation and reciprocal negation. The first includes three kinds, antecedent

dition," the relation of identity, as for instance of the sky; for the relation of identity (the relation, that a thing is to be comprehended under its own notion) is not regulating a condition, by the term "of only one thing," the notion of mutual negation. In the relation of contact, is for instance, a jar with the ground. The class of distinction is three-fold, viz. as referring to time, space and place. In the distinctive relation of time and space are all things. The distinctive relation of place is again two-fold, the distinctive relation of negation, and the distinctive relation of identity (of a thing with itself). The distinctive relation of negation is the site of negation. In the distinctive relation of identity is for instance the notion of the sky with the sky. In the relation of identity remains every thing with itself. In mutual relation is the notion of the jar with the ground.

8. *Comm.*—Negation is the reciprocal negation of the six categories, that is to say, negation arises from the six categories, being denied of each other. Negation is two-fold, universal negation and mutual negation. Universal negation is negation, different from mutual negation. Mutual negation is the negation of identity. Universal negation is of three kinds, antecedent, emergent, and absolute negation. Antecedent negation is a negation, which is afterwards removed, for instance, if it is said, in this half a jar is to be produced, there is a negation of the jar, which is to be produced. Emergent negation or destruction is a negation of what is produced, for instance, in the sentence, in these parts a jar is destroyed, there is a negation in the cause (the parts) subsequent to the production of the effect. Absolute negation is constant universal negation, for instance in the sentence, here is no jar. Here, this objection may be made: If a jar or any other thing is removed from a certain place, and again brought back to it, the notion of absolute negation cannot be applied; for, absolute negation being constant negation, the notion of absolute negation is not produced, when the jar is brought back. Hence they have assumed a fourth kind of negation, referring to the liability of a thing to be produced or destroyed, excluding absolute negation. For instance, in the notion: a black pot is not red, and a red not black, there is antecedent and

negation, destruction and absolute negation. The common notion of all seven categories is object of knowledge, and similar ideas.

14. The five first categories¹⁰ are positive, many and in the connection of intimate relation. The three first (substances, qualities, actions) have the attribute of existence; qualities and the subsequent categories are without qualities and actions.

15. Class (generality), and the subsequent categories are considered to be without generality; causality¹¹ is a predicate of all substances which are not atoms (whose measure is not an atom).

emergent, but not absolute negation. The modern school, however, reject this view, because they deny, that a contradiction has been proved; according to their opinion absolute negation is met with in emergent as well as in antecedent negation.

Negation is assumed as a distinct category; for in denying it, an infinite number of negations, corresponding to the things, whose negations they are, would be necessary.

9. Object of knowledge, &c. viz. capable of being known, named, proved, &c.

10. *Comm.*—The general notion (definition) of substances, qualities, actions, generalities and particularities is multiplicity, positiveness and connection by intimate relation. Multiplicity is also found in negation; therefore the distinction of the five is: the state of position in many. It is said, "which are in the connection of intimate relation," and not, which have intimate relation, because otherwise the categories of generality and particularity would be excluded.

11. *Comm.*—Causality is an attribute of all substances, whose measure is not an atom (परिमाणु means, whose measure is an atom.) Or: *Atoms, considered as a measure, have no causality.* A substance whose measure is an atom, cannot be the cause of any thing; for a measure commences things, which are included in its notion (as for instance the half of a jar is the measure, from which the jar is produced) but this is impossible in this instance; for a measure produces a measure, exceeding the measure, contained in its own notion (that is from a measure is produced something greater than itself) hence as the greater is

16. The notion of the necessary previous existence of a thing, which has not the fault of superfluous causality," is causality.*

17. Of this three kinds are specified, viz. causality of intimate relation, of non-intimate relation (the connexion of the

produced, if the measure commences from the great, so from the infinitely small (the atom) would be produced something smaller (more an atom). This is impossible (hence the measure contained in the conjunction of two atoms, is not produced from the measure of an atom, but from number). For the same reason causality must be denied of substances which are infinite, further of any class, transcending the senses, and lastly of particularity. (The reason for this is clear; any thing infinite which can be exceeded, must have become finite; there cannot be any thing which exceeds the senses more than another thing, both being thought under the same idea, viz. to exceed the senses. Particular are the distinctions of eternal things; they cannot be distinguished by any thing else, because they are the last distinctions.)

12. I give here a note of the Bengali translation. The category, which has not the fault of superfluous causality, and whose existence constantly precedes, is causality, or cause is, by the existence or non-

* The principal Sūtras of Kaṇāda, referring to causality, are:

कारणाभावात् कार्यभावाः । 1st Adh.

कार्यभावात् कारणाभावः ॥ 1st Adh.

कारणपूर्वकः कार्यगुणो दृष्टः । 1st Adh.

कारणमिति द्वये कार्यसंभवायात् ॥ 10th Adh.

कारणे समवायात् कर्माणि ।

(समवायिकारणमिति द्वयः ॥) } 10th Adh.

तथाकृते कारणे कार्यसमवायाच्च ॥ 10th Adh.

If there is no cause, there is no effect.

If there is no effect, there is no cause.

The quality of the effect depends upon the cause.

The cause, which refers to substance, is intimate cause, because substance is intimately related to effects, (viz. compound substances, qualities and actions.)

Action is a non-intimate cause, because they are intimately related to the cause (the intimate cause.)

In the same manner are qualities intimately related to substances; therefore they are also non-intimate causes.

component parts); and instrumental causality is mentioned as the third by the followers of the Nyáya philosophy.

18. That from which in its intimate relation an effect is produced; (for instance thread from which cloth is made,) is causality of intimate relation; that which is proximate to this, (the conjunction of the threads) is the second cause, (of non-intimate relation), and as the third (instrumental causality) must be considered what is different from either, (for instance the loom of the weaver.)

19. There are five classes of superfluous causality,¹ viz.

existence of which the existence or non-existence of an effect is necessary. If there is no thread, there is no cloth; if there is no conjunction of the two halves of a jar, there is no jar; if there is no virtue, there is no happiness, &c. There are three kinds of causes, intimate, non-intimate and instrumental causes. Such things as, intimately united, (that is, such as are in the connection of intimate relation) produce an effect, are intimate causes. Two atoms for instance are the cause of a bi-atomical compound, threads of cloth, the two halves of a jar. Non-intimate is a cause, which is proximate to an intimate cause, that is, which is connected with the intimate cause; for instance the conjunction of two atoms is the proximate cause of the bi-atomical compound, the conjunction of threads of cloth, the conjunction of two halves of a jar. Instrumental is the cause, differing from either; for instance, the instrumental cause of a jar is the stick, of cloth the loom, of a bi-atomical compound god. It must here also be borne in mind, that an effect may be destroyed either by the destruction of the intimate cause, or by that of the non-intimate cause, as a jar is destroyed by the destruction of the two halves, and a bi-atomical compound by that of the conjunction of the two atoms. The intimate, non-intimate and instrumental causes are called special causes; God, the omniscience of God, desire, endeavour, time, space, antecedent negation and fate (virtue and vice) general causes.

13. A cause is called superfluous (अवयवविह्वलः) if, without its co-operation, the effect is produced in another way. Commentary. Faults of superfluous causality are: 1. The notion, under which the cause is per-

1st.—*The general idea* (class), under which the former state of a cause is perceived; 2nd, that *the existence or non-existence* of which can only be comprehended by the existence or non-existence of the cause; 3rd, that of which the previous existence is applied to the effect, when its previous existence is already applied to another (effect).

20. 4th, that *the existence of which is applied to the effect*, because it necessarily precedes the existence of the producer of the effect; and 5th, that which is superfluous beside the thing whose former existence is necessary.

21, 22. Of the first class is an example the notion, under which the stick (by which a jar is made) is perceived, of the second the form, &c. of the stick, of the third the ether, of the

ceived, as for instance the idea of a stick (दृश्यं the class of a stick) by which (stick) for instance a jar is produced. 2. Such things as cannot be thought of themselves as causes of the existence or non-existence of an effect, but are causes of the existence or non-existence of an effect only by means of the *real* cause, as for instance the shape of a stick; (for it cannot be said, that, if this or that shape of a stick is given, the effect, viz. the jar, is given, nor, if this or that shape of a stick is not given, the jar, is also not given.) 3. The application of a cause to an effect, if this cause has been already applied to another effect, for instance, if the ether should be considered as the cause of a jar. The ether could be only the cause of a jar by its being perceived under the notion of ether; this, however, is the intimate cause of sound, and it is therefore first taken as the cause of sound, and secondly as the cause of the jar. 4. The application of a cause to an effect, by which (cause) the (actual) cause of an effect is produced; for instance, if the father of the potter would be considered as the cause of the jar; for the potter only is the producer of the jar. 5. The application of any thing (as cause of an effect) which is not necessary to the production of the effect, as for instance the donkey, carrying the earth, &c., of which a jar is made. Of all the kinds of superfluous causality the last alone is necessary, as including the other kinds.

fourth the father of the potter, of the fifth the donkey, &c. Among those superfluous causes the last alone is necessary (because the others are included in it).

23. Intimate causality belongs to substances, non-intimate causality only to qualities and actions.¹⁴

24. Dependence¹⁵ is the attribute of every thing, save eternal substances. The property of all nine kinds of substances is: to have substantiality and qualities.

25. Earth, water, light, air and mind are the sites of comprehensive and non-comprehensive generality, form,¹⁶ action and velocity.

26. Time, ether, soul and space have the attributes of ubiquity and infinity.¹⁷ Of the five elements, viz. earth and the subsequent four substances (water, light, air, and ether), are the first four the sites of touch.

27. The commencement of things takes place in the four first substances. The special qualities of ether and soul¹⁸ are: limitation to space, and momentary duration.

14. Intimate causality belongs to substances; non-intimate causality to qualities and actions, that is, intimate causality is the common attribute of substances, non-intimate causality that of qualities and actions.

15. *Comm.*—Dependence is the common attribute of all things except eternal substances; it is to be thought under the idea of intimate relation. Eternal things are only dependent on distinctive relation (vide p. 7) as for instance on the relation of time. Eternal substances are atoms, (viz. of air, fire, water, earth) ether, time, space and soul. The common attribute of substances is, substantiality and substrate of qualities.

16. Form (मूर्ति) is, the measure of which is limited.

17. Infinity (परमं महत्तमं) is, the measure of which exceeds every other measure.

18. *Comm.*—The special qualities of the ether and soul are: a state which does not pervade (is limited), and a state which has only momentary duration. (A state which does not pervade is such as is produced only in one part, and is not present in another. And a thing has momentary duration, if in the third moment after its production it is

28. Earth, water and light, have the properties of colour, fluidity and perceptibility by the senses ; earth and water have gravity and taste ; the fluidity of earth and light is a derived one.

29. The soul and the elements have special (contrary) qualities ; that which is considered the property of the one, is the opposite of the others.

30. The qualities of the air are touch, number, quantity, individuality, conjunction, disjunction, priority, posteriority, velocity and faculty. The same first eight qualities together with colour, fluidity and velocity are assigned to light.

31. Water is the site of 14 qualities, viz. of the eight, before mentioned, and further of velocity, gravity, fluidity, colour, savour and viscosity.

32, 33. Earth has the same qualities, with the exception of viscosity, and the addition of smell.—The 14 qualities of the soul are intellect, pleasure, pain, desire, aversion, volition, number, quantity, severalty, conjunction and disjunction, faculty, merit and demerit. The qualities of time and place are number, quantity, severalty, conjunction and disjunction. The same qualities together with sound belong to the ether.

34. Those five qualities, together with intellect, desire and volition are sited in God, the same five qualities, with priority and posteriority and velocity, in the mind.

destroyed.) The special quality of the ether is sound, which does not pervade : for it is produced in a small part only of the ether, and not found in a different portion. It has only momentary duration ; this means, it is destroyed in the third moment, *after* it has commenced to exist. Because the respective special qualities of pervading substances are destroyed by the same qualities which are afterwards produced, therefore the first sound is destroyed by the second. The same is the case with knowledge, &c. ; for knowledge is produced in the soul, which is a pervading substance, within the limited space of the body, and it is absent in any other part of space, for instance in the part belonging to a jar. In the same manner knowledge continues only for two moments, and pervading substances are therefore those whose special

35. The earth is the cause of smell (the intimate cause), and the site of the various colours. Savour is of six kinds (sweet, bitter, pungent, astringent, acid and saline), smell two-fold (fragrance and stench).

36, 37. It has three kinds of feel, hot, cold and temperate. It is twofold¹⁹ eternal and non-eternal; eternal as considered in its atoms, non-eternal as being composed of parts; this latter is threefold, organism, organ and object (inorganic matter).

38. Organisms are viviparous, oviparous, engendered in filth and vegetative; organ is the sense of smell; objects are all compound substances from the smallest, of two atoms, to the largest, Brahmā's egg.

qualities are : existence that does not pervade, and momentary duration. The special qualities of earth, &c., are : existence which does pervade, and continuance for a longer time.

19.* *Comm.*—Earth is two-fold, eternal and non-eternal, eternal in its atoms,* non-eternal, if different from atoms, viz. if consisting of two, three, &c. atoms. Earth, if non-eternal, is composed of parts.

If it is said : 'What evidence is there, that earth is composed of parts; (viz. a part being already a compound of two, three, &c. atoms) for you obtain the same notion, if any earthly substance, as a jar, is thought to be composed of the totality of the single atoms. *Under this supposition you need not fear*, that the invisibility of each single atom implies the invisibility of a jar, &c., *which consists of atoms*; because, although each single atom is invisible, yet the totality of them is visible, as from a certain distance the hairs of the head together are visible, although none of them alone is visible. Moreover we arrive at the idea for instance of one extended great jar, as we arrive at the idea of one great heap of rice.'

We reply : If one atom is no object of the senses, a totality of atoms is also beyond the perception of the senses. As to your example,

* सदकारणवन्नित्यं ॥ 3. A. Kap. Sút.

अतो विपर्ययादयः ॥ 4. A.

An atom is, what exists has no cause, and is without commencement and end; an atom is contrary to what has a measure (अतःपदमनन्तत्वात् अतिदीर्घत्वाच्च ।)

39. Water has white colour; its taste, and feel, are sweet and cold; it has also viscosity, and its fluidity is innate.

40. As to its eternity and non-eternity the same holds good as before; its organisms are not born. Its organ is the tongue; its objects are the sea, snow and similar substances.

41. Light is hot to the feel, its colour white, its fluidity not innate, but an effect from some cause; eternity and non-eternity are attributed to it in the same way as to the earth.

42, 43. Organ is the eye, objects are fire, gold, &c. The feel in the air is considered as natural; it is *temperate*, neither hot nor cold; its motion is crooked; its qualities are touch, &c.

we maintain, that a hair, although at a distance, is not beyond the perception of the senses, because it will be perceived, if brought nearer. Nor can you say, that from a totality of invisible atoms a totality of visible atoms is produced, on the ground, that it is not contradicted by perception; for visible things are not produced from invisible things; otherwise heat of the eye for instance would one or the other time become visible. If you say, that a quantity of invisible heat, contained for instance in very heated oil, may produce a visible burning, we object; for the visible burning arises from the visible parts, contained therein.

You can also not maintain, that from the invisible compound of two atoms the production of a compound of three atoms (which is visible) is impossible; for we do not say, that the visibility or invisibility of a thing arises from its own nature but from its necessary cause, as greatness, manifest form, &c. A compound of three atoms for instance is visible on account of its greatness, but not a compound of two atoms, as it has no greatness. This, however, is according to your view, impossible, because there is no greatness in an atom.—As in this manner it is proved, that *earthly substances as a jar*, are composed of parts (a part, as above already reminded, is a compound of at least two atoms) so it is clear, that they are not eternal, in consequence of their production and destruction. And there is no difference between the mountain Méru, and a mustard seed, because in either there is the same composition of parts after parts. Therefore it is necessary, that there should

Eternity and non-eternity are assigned to it as before to the other elements. Its organ is the skin, which extends over the whole body; objects are all substances, intermediate between the vital air and the great element.

44, 45. The distinguishing quality of the ether is sound, organ is the ear. Though one, it has many titles. Time²⁰ is thought the producer of all that may be produced, and the support of the worlds; it is the cause of the knowledge of

be somewhere an end (in the division of parts). To say; that the point, where the end is obtained, is not eternal, would be to admit the production of an effect from a thing which is not in the connection of intimate relation. Therefore this point is eternal. As the continual progress from one great thing to another still greater, finds its end in the assumption of the sky and other infinite substances, so there must also be ultimately a cessation of the progress from a small to a smaller thing. Thus the necessity of atoms is proved. There is, certainly no end of the division, if one has arrived at the compound of three atoms, because a compound of three atoms as an object of the eye, has parts like a jar, &c.; for from the argument, that the parts of a compound of three atoms have parts on account of its size, like the half of a jar, it is evident, that such a compound has parts. Nor can you say, there is no necessity for this (for assuming parts of such a small compound as that of three atoms) because many things (atoms) are required to produce a magnitude for so small things. This, however, does not prove the necessity of a continuation of parts after parts, because thereby a regress is infinitum would become necessary.

20. *Comm.*—Time, the producer of all productions, is the substrate of the world. This is proved by the perception of the "now." If for instance the perception: here is now a jar, is given, there exists a union between the motion of the sun and the jar. This is not conjunction (vide p. 7) or any other relation (for conjunction is between the parts of two or more things,) but it is a relation of a different kind, which is produced by time.—That time is to be thought under the notion of a substrate, is evident from its being the cause of priority and posteriority. Time is the special (non-general) cause of the perception of priority

priority and posteriority; *though one*" it has many names as that of moment, &c.*

46. Space is the cause of the notions of distance and proximity; it is one and eternal.

47. Though one, it obtains various designations, as east, west, from the division of its attribute. The soul is governing" the

and posteriority. Or if both definitions are combined: Time is the substrate of the *special* union, which is the non-intimate cause of priority and posteriority.

21. *Comm.*—Although one, it has many names, viz. moment, hour, day, &c., past, future and present time. Past is the time, whose destruction is present, as yesterday; future is the time, whose future existence is present, as to-morrow, and present is the time, whose future existence is destroyed and whose destruction is (to come to pass) future, as to-day. There will, after every future moment, be another moment, because there will be always another action (the junction of which with other things produces the relation of time); this will be the case at the general conflagration, where also the terms of "moment," "day," &c. are applied.

22. *Comm.*—"The soul is ruling the senses and the body."—The class of soul is the class, by which the intimate cause of happiness, and unhappiness, &c. is comprehended (or: soul is the intimate cause of happiness and unhappiness, &c. and the substantiality of the soul is proved by its being the substrate of the qualities: happiness, unhappiness, &c.) Īswara (the ruler, God) is thought under the same notion (class); but since such causes as merit and demerit do not exist with regard to him, he is not subject to happiness or unhappiness; for we do not admit the invariableness of the rule that, that which is a consequence from the nature of a thing, will necessarily exist.*

Others† say: The notion (class) by which the soul‡ is thought, is not applicable to Īswara, as there is no proof for this; yet hence it does not follow, that a tenth substance must be assumed, as *the soul* is dis-

* Or in other words, for though it is necessary, that when there is an effect, there is also a cause, yet it is not necessary, that, when there is a cause, there is invariably an effect.

† Probably the ancient Nyāya is meant.

‡ The individual soul.

senses and *the body*; for an organ (instrument) must possess its agent.

.48. There is no consciousness³³ in the body, as is proved by its disappearance after death. If such were the case, how could recollection remain, when the senses are destroyed.

tinguished from *the other substances* by the idea: to be subject of knowledge. "Is governing the senses," &c., because it successively produces the conscience of the senses and of the body. Although there is in the soul the perception: I know, I am happy, &c., yet it cannot at first be proved against one who holds the contrary opinion, that the soul is something different from the body, etc. To prove this, the text says: "for an instrument must possess its agent." As an instrument, for instance a knife, the instrument for cutting, has no effect without an agent, so also the eye and the other senses, which are instruments for knowledge, have no effect without an agent. For this reason an independent agent is assumed.

23. To show, that the body is not the agent, it is said in the text: "There is no consciousness in the body, as is proved by the disappearance of consciousness after death." If it is maintained: 'Conscience is knowledge, and this in your opinion is not present in the soul which has obtained liberation. Why should it therefore not just as well be absent in a dead body, because, if life ceases, also knowledge ceases?' We answer: this is impossible; for, if consciousness belonged to the body, there could in old age be no recollection of things, perceived in childhood, the body being subject to increase and decrease by acquiring and losing its particles.

Nor can it be said, 'that by an impression, produced in a former body, an impression in the second body is produced,' because this would oblige you to assume an infinite number of impressions.—Further, if consciousness were inherent in the body, a child could not commence to take the milk from the breast of its mother; for the cause of this action is the knowledge of what accomplishes the desire, and at that time there does not exist the recollection of any means, accomplishing the desire. According to my opinion the commencement of the action takes then place by the recollection of the causes of the desires, experienced in a former birth. Nor can it be objected: 'Well, if this be true, let any body

49. The mind is likewise not the site⁴ of consciousness, because then knowledge and other *internal* qualities would remain imperceptible.

recollect any thing else, experienced in a former birth;’ for there is nothing which calls it into recollection. In this instance there is no other means but to admit of fate for the individual soul. If this is the case, the body is without commencement, and also the soul. Hence the eternity of the soul also follows; for what is without beginning, cannot be destroyed.

‘Well, let us then transfer to the eyes and the other senses the notion of cause and agent with regard to knowledge; for otherwise no cause is possible.’ The answer is: ‘If such were the case, how could recollection remain, when the senses are destroyed.’ If the eyes and other senses were destroyed, how could, by the absence of the eye, recollection remain, as the subject which perceives exists no more, and as it is quite unreasonable, that the same thing should be seen by one, and recollected by another sense, because perception and recollection must depend on the same subject, as being cause and effect.

24. *Comm.*—‘Let then consciousness not belong to the senses (external) but be maintained for the eternal mind.’ The answer of the text is: ‘The mind is likewise not the site of consciousness, because then knowledge and other *internal* qualities would remain imperceptible;’ for as the mind is an atom, and as the cause of every perception is a certain greatness, no perception could take place, if knowledge, happiness, &c. were placed in the eternal mind. How mind is an atom, will afterwards be explained.

If it is said, (by the Védāntists): ‘The soul is knowledge; for its consciousness is proved by its self-manifestation; but knowledge of *this* or *that* object, happiness, &c. are special forms of it.’ And because this (special form) has only the existence of a production (भावत्वात्; I translated जन्यभावत्वात्) its duration is momentary. Further, since the preceding knowledge is the cause of the consequent knowledge, and the former again the effect of a preceding, there is even in deep sleep an uninterrupted chain of knowledge down to the time of universal destruction, as the smell of musk remains in cloth. And by the communication of the impressions, produced by prior and prior acts of

knowledge, with posterior and posterior *acts of knowledge*, recollection and similar acts are possible.'

We deny this; for if the object of recollection is the world, omniscience would be obtained (because knowledge is a product of self manifestation); and if the object is something, there is no proof for the second member of the alternative; for hence would also follow, that in sound sleep knowledge were manifesting its object.

And if you say, 'that in this state (in the state of sound sleep) knowledge remains, but without form,' we object also; for you cannot prove, that knowledge manifests itself, as otherwise such things as a jar, &c. would also be possessed with knowledge.

Nor can you say, 'that this would answer your purpose;' for it is impossible to reject the perception of a jar and similar things.

If you maintain, 'that this is a special form of knowledge,' we would ask, what is that form? Is it distinguished from knowledge, we agree with the assumption of something different from knowledge. Is it not distinguished from knowledge, then in accordance with the general notion of knowledge, a jar of blue colour would be the same with one of yellow colour, because by its own nature there is no distinction of knowledge.

If you pretend, 'that any special property of knowledge, as yellow and blue colour, &c. must be abandoned,' we object, because the contrary notions of blue, yellow, &c. cannot be predicated of one and the same thing; otherwise it would be difficult to connect any meaning with contrary ideas.

Nor is there any communication of desires, because the communication of desires even between son and mother is impossible.

You can also not say, 'that there is a rule for things, that are the causes, and others that are the effects of communication,' because there is no communication of desires.

And if you define 'communication to be the production in something else,' there is again a contradiction; for there is no producer.

If you contend, 'that it is produced by another knowledge,' you must admit another knowledge of the same kind, and so on in infinitum.

If you think, 'there is but little contradiction in a momentary knowledge,' you cannot prove such a knowledge, and your assumption is complicated.

For the same reason consciousness in bodies of momentary duration is rejected, because it has the fault of complication and cannot be demonstrated; in the same manner the production of the fruit from the seed and from collateral causes is evident, so that there is no need of assuming a special form of making, &c.

‘Let the assumption of a momentary knowledge be complicated, yet you must grant, that the soul is eternal knowledge, which cannot be destroyed; for the Sruti says: Lo, this is the soul, true knowledge, the infinite Bramha.’

We object also to this, because such a knowledge is evidently without object, and because it cannot be proved, that knowledge has no object; in this case it would not have even itself as an object.

Therefore, it has been proved, that the soul is different from knowledge, and that it is eternal.

True knowledge, that is the supreme Bramha, is not found in individual souls, because they are clearly distinguished from it by knowledge and ignorance, happiness and unhappiness and similar qualities, and in consequence the difference of Iswara is established. Otherwise servitude and liberation were names without meaning.

If it be objected: ‘The same text of the Vēda which explains the difference of Iswara, brings also forward his identity by his indifference; for it says: “Let us strive for the state of indifference, therefore all is placed upon the soul,” and also: “In the state of liberation ignorance is annihilated.”

We deny this, because, the difference being eternal (constant) its annihilation is impossible. Admitted even, that the difference is destroyed, a dualism is *for this very reason* established, and it cannot be said, that duality is destroyed. And as it is well said, that to Bramha in his state without qualities, and therefore without the quality of existence, existence is yet attributed, so it is also well said, that although there is no duality, still there are two possessed of duality.

If you say, ‘that the absence of unreality which is the place of identity, is there meant with existence,’ we say likewise, that the absence of identity which is the state of two possessed of duality, is meant with duality.

Although every unit is comprehended by the notion of unity, still one is not both, as it is said: smell is no attribute of earth and water,

which is clear to every body. As regards the passage of the Śruti, establishing the indifference at that time (the time of liberation), it establishes in fact an equality by the removal of unhappiness, &c., as it may be said, that this Purōhita by great prosperity has become a King. In this sense it is said in the Śruti: "He who is without sin, obtains the supreme state," meaning equality.

God is not the soul which is knowledge and happiness, but the substrate of knowledge. In such a sentence as: "Bramha is eternal knowledge and happiness," the term "knowledge" means the substrate of knowledge, by the authority of a passage like this: "He who knows all, is omniscient;" hence happiness means also a person who is happy.

Hence is also the doctrine of the Sāṅkhyas refuted, which is as follows:* Nature, (Prakriti) is the agent; the soul (Pūrusha) remains

* To understand more clearly the argument of the Nyāya against the Sāṅkhya, I shall briefly state the principles of this doctrine. According to the Sāṅkhya there are two kinds of substances which are the substrates of all phenomena, nature and soul. Nature (Prakriti) is one and undistinct in its original state, which is incomprehensible to the senses. As such it is Mūla Prakriti, nature as the root of all things. It is productive, and in its productions various. Nature in its state as production is Vikriti, changed, or derived nature. The first production is intellect (Buddhi) or the great one, Mahat, which as a production of nature has no consciousness.—The soul (Pūrusha) is manifold, or there are many souls. The soul, as contrary to nature, is not active, but it is conscious. Accordingly it has no activity in the production of ideas, which are given to the soul by intellect, and the opinion, as if the soul were an agent, is a mere delusion.

The following quotation from Prof. Wilson's Sāṅkhya Kārika will still more elucidate the subject (p. 16.)

... III.—Nature, the root (of all) is no production. Seven principles, the great or intellectual one, &c., are productions and productive. Sixteen are productions (unproductive). Soul is neither a production nor productive.

Bhāṣya. Mūla (the root) prakriti (nature) is pradhāna (chief) from its being the root of seven principles which are productions and productive; such nature is the root. "No production." It is not produced from another... "Seven principles,"—Mahat and the rest, from its being the great (mahat) element; this is intellect (Buddhi).

... The seven principles are 1. intellect; 2. egotism 3—7, the five subtile rudiments. These seven are productions and productive, in this manner. Intellect is produced from the chief one (nature) that again produces egotism, whence it is productive (prakriti). Egotism as derived from intellect, is a production; but as it gives origin to the five subtile elements, it is productive. The subtile rudiment

without stain (that is untouched, neither active nor suffering) as a lotus-leaf by water; but it is conscious. It is without causality, because there is no difference between cause and effect (cause and effect are identical) and hence with the destruction of the effect, that which is like the effect, would also be destroyed. This idea (that the soul is conscious) is necessary, because the perception of consciousness which is found in intellect, would be otherwise impossible. Intellect is a modification of nature. Intellect is also called greatness and the internal organ. Under the condition, that it (intellect) exists or not exists, the soul is subject to transmigration or liberation. Its modification has the form of knowledge through the channel of the senses. If it (this modification of knowledge) is in connection with external things, as with a jar, &c., the perception of agency takes place in the soul, and the perception of consciousness in the intellect, on the ground, that the difference is perceived. For instance if it is said: "By me this is to be performed;" the first member of the sentence, "by me," means the perception of the soul, which is without reality, because it is the reflection of consciousness (in the intellect) by the clearness of the intellect, as the reflection of the face in a looking-glass (is without reality by the clearness of the looking-glass). The second member: "this" means the perception of the object, which by its being modified through the channel of the senses, has reality (truth) as the unclearness, produced by breathing upon a looking-glass. The third member: "Is to be performed" refers to the performance of business. Hence is intellect possessed of three parts. The connection of the soul (Pūrusha) with knowledge, which is a modification of intellect, is called untrue, as is the percep-

of sound is derived from egotism, and is therefore a production, but as causing the production of ether, it is productive. The subtile element of such as generated from egotism, is a production, as giving origin to air, it is productive. The subtile rudiment of smell is derived from egotism, and therefore a production; it gives origin to earth, and is therefore productive. The subtile rudiment of form is a production from egotism; as generating light, it is productive. The subtile rudiment of flavour, as derived from egotism, is a production; it is productive, as giving origin to water. In this manner the great principle and the rest are productions and productive. Sixteen are productions; that is, the five organs of perception, the five organs of action, with mind, making the eleventh, and the five elements; these form a class of sixteen which are productions, the term vikāra being the same as vikriti. Soul is neither a production nor productive.

The site²⁵ of merit and demerit is perceptible²⁶ by its being united with distinguishing qualities.

tion of the face in an unclear looking-glass. What has been said about knowledge, &c., is also true with regard to happiness and unhappiness, desire and aversion, endeavour, merit and demerit, because they are evidently identical as being effects of intellect; but intellect is not possessed of consciousness, because it is a modification.

This doctrine of the Sāṅkhya is refuted on the ground, that consciousness is dependent on the same substrate, as action, fate and enjoyment, because there is no proof, that there is another substrate, different from this.

If you say, 'that from such a sentence as: I, who am conscious, am acting, an error of the part of consciousness is possible in consequence of the modification of intellect,' we reply by asking, whether this is not also possible on the part of the agent. Otherwise, if intellect is eternal, there is no liberation, or, if it is not eternal, there is no transmigration.

If you further contend, 'there is no consciousness of intellect, because it is an effect of unconscious nature, as effect and cause are identical,' we protest, because this has not been shown; there being no proof, that the agent is a production; for from the text, that it is without passion, that it has no birth, it follows, that it is without beginning, and as such it is also without end, as it is unreasonable, that it should be destroyed. Of what use is therefore the assumption of nature (Prākṛiti) and similar notions?

Nor can you say, 'that our opinion does not agree with the passage of the Bhagavadgīta saying: "by the qualities of nature are everywhere actions done; the soul, blinded by pride, fancies: I am the agent;" for its real meaning is: by "nature's," fate's, "qualities," the qualities, produced by fate, viz. by desire, etc., I am agent. If this is the case, the intention of the Bhagavadgīta is attained by the words: He, who believes the soul to be the sole agent, is liberated.

25.—"The site," &c., viz. the soul is the site. If the body were the site of them (merit and demerit, &c.), the consequences of the works, done in a former body, could not be experienced by a later body.

26.—"It is perceptible by its being united with distinguishing qualities." The soul becomes perceptible by its being united with its respective special qualities, and not in another way by such an observation: I know, I do.

50. It can be deduced from activity" and similar phenomena, as the chariot^{er} from the motion of the carriage. It is the site (substrate) of egoity, and perceptible only through the mind.

51. It is pervading, and the site of intellect and other qualities. Intellect is two-fold, apprehension and remembrance. Apprehension includes four sorts, viz.

52. Perception, inference, comparison and verbal knowledge. Perception" comprehends six kinds, in accordance with the six organs of perception.

53. The object of the nose is smell and the notion of

27.—*Comm.* "It can be deduced from activity, &c." That the soul is in another body, is inferred from activity, etc. Activity means here exertion. As it has been mentioned before, that knowledge, desire, endeavour, &c. do not exist in the body, and further as exertion implies endeavour, it follows that there is a soul which has endeavour, on the ground that there is exertion.

28.—*Comm.* Perception is the knowledge (apprehension) which is produced by the senses, and the cause of evidence from perception are the senses. Inference is the apprehension, produced by the knowledge of a general proposition (Vyāpti) and inferential proof, is the apprehension, produced by the knowledge of a general proposition, which is the cause of the conclusion. Comparison is the knowledge, produced by similarity, and proof by comparison is the knowledge of similarity, which is the cause of comparison. Verbal knowledge is the apprehension, produced by the knowledge of words, and proof by verbal knowledge is the knowledge of words, which is the cause of the former.

29.—&c., means the notion of good and bad smell.

* Similarly says Kaṇāda: प्राणायामनिमेषोन्मेषजीवनमनोमतीन्द्रियान्तरविकारः
दुःखदुःखेष्टाद्वेषप्रयत्नाद्यान्मोक्षमिहानि ॥ Sūtr. 4th Adh. The vital airs, which go upwards and downwards, the closing and opening of the eyes, life, the actions of the mind, and the modifications of the other senses, happiness and unhappiness, desire and aversion, and endeavour, are proofs of the soul.

smell, etc.³⁰ Thus the object of the tongue is savour,³⁰ and sound that of the ear.³¹

54-55. Object of the eye is proportionate form.³² Substances of such kind (of perceptible greatness) individuality, number, conjunction and disjunction, priority, posteriority, viscosity, fluidity, quantity, action, class, and the relations which are appropriate to the respective objects are perceived by the eye through the contact of light with proportionate form.

56. Substances, perceptible of touch, are objects of the skin; the objects of the eye, with the exception of colour, are also objects of the skin.

57. In the perception of substances is the union of the skin with the mind the cause of knowledge. Through the mind are perceptible: pleasure, pain, desire, aversion, intellect and volition.

58. A knowledge which is without determination, is beyond the perception of the senses.³³ *Proportionate* greatness is the cause as regards the perception of the six classes; organs (instruments) are the different senses.

30.—Further, sweetness, &c.

31.—Sound, articulate and non-articulate, &c.

32.—Proportionate means fit to be perceived. The same proportionate greatness must be admitted also with regard to the objects of the other senses.

33.—*Comm.* "A knowledge which is without determination, is beyond the perception of the senses." If (for a man who has not the knowledge of a jar) the contact of the eye etc. (with the jar) has taken place, the determined knowledge: This is a jar, viz. determined by the general notion (class) of a jar, does not exist, because there was not before the knowledge of that, which is determining, viz. the general knowledge of a jar, &c.; for the cause of a determined knowledge is another which is determining. For instance at first is produced a knowledge, not determined by the two parts,—that which is to be determined, and that which is determining,—as a jar and the general notion (class) of the jar. Such a knowledge is without determination, and no object of perception; for from perception it is evident that I know

59. The connexion of the senses with their objects is called intercourse ; this is also six-fold. 1. The perception of things takes place by contact. •

60. 2. The perception of what is in intimate relation with the things, by intimate relation with that which is in contact.

61. 3. The perception of what is in intimate relation with the last mentioned relation, (viz. intimate relation with that which is in contact,) by the corresponding intimate relation, (intimate relation of that which is intimately related with that which is in contact.) 4. The perception of sound, by intimate relation. 5. The perception of what is intimately related with sound, by the intimate union with that which is intimately related, and 6. The perception of every negation by particularity.*

62. If it takes place, it is perceived, at the place where it happens to be. Intimate relation is perceived by particularity.

63. Transcendent intercourse" is three-fold according to its division into intercourse whose character" is general," or

the jar. In this perception is knowledge the determination of the soul, the jar that of knowledge, and the general notion of jar the determination of the jar. The determination which is in the determination, is called the general notion of determination. The knowledge containing the general notion of determination, is the cause of the knowledge determined by determination. For instance in the knowledge without determination of a jar is the general notion of a jar not determining. Therefore when there is an undetermined knowledge of a jar, there is not such a knowledge, as : I know the jar under the general notion of the jar, (that is to say, not such a determined knowledge, by which the soul is determined by knowledge, knowledge by the jar, and the jar by the general notion of the jar.)

34.—*Comm.* "Transcendent intercourse." Perception is two-fold, common and transcendent. The intercourse of common perception is of six kinds, which have just been explained. The intercourse of transcendent perception is three-fold.

35.—*Comm.* If in this definition the term "character" denotes its

* See note to v. 11.

whose character is knowledge, or which is produced by Yoga.

nature (its identity with itself) the meaning is, that the intercourse is of a general nature, and this must be understood as the determination of a determinable knowledge which is in connection with any of the senses. For instance, let smoke be in contact with the eye. Here is smoke the determinable knowledge, and the general notion (class) of smoke, which (general notion) forms the intercourse, is a knowledge, whose object is every smoke whatsoever. If it is then said, that such a knowledge is in contact with a sense, the consequence would be, that, if a cloud of dust by mistake were apprehended under the notion of smoke, there could not arise a knowledge, whose object is every smoke whatsoever, as in this case with the general notion (class) of smoke no connection of the senses could take place. According to my (the author's) opinion, however, the cloud of dust is in contact with the eye; the knowledge to be determined is smoke, and the general notion of smoke, which is here the determination, the intercourse. Its contact with the sense is the common one, which takes place on the part of the external sense. On the part of the mind, however, the intercourse is merely general, and determining the knowledge. Hence if by words any kind of perception of a *Pisácha*,* &c. has been obtained, the apprehension of all *Pisáchas* is produced.

The term "general" means *here* rather the state of similar things, and this is sometimes constant, as the general notion of smoke, &c. sometimes not constant, as a jar, &c. For instance a jar is perceived either in contact with the ground, or in intimate relation with its half. Hence arises afterwards the knowledge of all such things, as a jar, either in contact with the ground, or in intimate relation with their halves. This must be so understood, that the intercourse of similar things (of things included in the same notion) depends on the same relation, under which the generality itself is comprehended. On the other hand where after the destruction of this jar, &c. a recollection arises of a thing like this jar, there could not, by the intercourse of a general character, take place the perception of all things like this jar, because the generality would at that time be not present. Moreover, suppose the knowledge of a jar to be determined by the contact with any sense. Here does not exist even the next day a contact with the eye, yet there arises a knowledge of similar things, because there is a generality which

* A kind of goblins.

64. The intercourse of things, comprehended in a notion, is called general knowledge. It is required a thing which manifests this or that property produced by this or that sense."

65. The intercourse of any thing, of which there is a knowledge, is called the intercourse, whose character is knowledge".—The intercourse, produced by Yoga, is of two kinds,

determines the knowledge of similar things. Therefore the "knowledge" of "generality" is the intercourse, and not "generality." With this view it is said in the text :

36.—*Comm.* Intercourse, "whose character is general." The term "character" means object, and the sense is : intercourse is a knowledge whose object is general.

"But where without the contact of the eye, &c. the knowledge of the common state of similar things (generality) exists, should there not be a perception through the eye of all jars, &c. ?

37.—*Comm.* To remove this objection, the text says ! "It is required something which manifest this or that property, produced by this or that sense."

The meaning of this is : When by an external sense through an intercourse of a general character knowledge is to be produced, there is required an object of knowledge, to be produced by one of the other sense, of this or the other generality, with reference to a thing whose generality it is. This object is the contact (or a similar relation) of the light, further the contact of the eye, &c. Hence such a knowledge is not produced by the eye for instance, when it is dark.

But if the intercourse whose character is knowledge, is an intercourse, whose nature is knowledge, and if the intercourse whose character is general, is defined in the same way, what difference then is between them ?

38.—*Comm.* To show this, it is said in the text : "The intercourse of any thing, of which there is a knowledge, is called the intercourse whose character is knowledge."

Namely an intercourse, whose character is general, produces a knowledge of the things upon which it depends ; but an intercourse whose character is knowledge, is intercourse of the knowledge with that object to which it refers, (which is comprehended by it.) The mean-

that which belongs to the Yogi who is perfect, and that which belongs to the Yogi, who strives after perfection."

66. The intercourse of the former is a constant manifestation, that of the latter takes place by the assistance of meditation."

The intercourse, as regards inference, is consideration," the (instrumental) cause the knowledge of a subject, invariably con-

ing of this is : A perception does not become manifest without intercourse. First without an intercourse whose character is general, how could there exist by the mere notion (class) of smoke and fire, an apprehension of every smoke and fire whatsoever ? For this reason an intercourse whose character is general, is necessary. The objection, 'that it does not matter, whether there is an apprehension of every smoke and fire whatsoever,' is not valid ; for with the visible smoke the connection of fire is indeed perceived, but no other kind of smoke is included therein, and therefore a doubt, whether smoke is invariably connected with fire or not, could in this case not arise. According to my opinion, however, the doubt, whether smoke, in whatever place or time, is to be predicated of fire or not, takes place through the intercourse of general character, by which every smoke whatsoever is comprehended.

The objection, 'that on the supposition of an intercourse of general character man would be omniscient, because in the notion of all objects of knowledge every single object of knowledge is included,' is also untenable ; for although all objects of knowledge may be known by this notion, yet, there is no omniscience, because the differences of all objects are not known.

Secondly, if no intercourse whose character is knowledge, were assumed, how could there be in the knowledge : "sandalwood is fragrant," also the perception of a thing, which is fragrant ? Be knowledge of fragrant things granted through the intercourse whose character is general, but the notion of fragranciness is only possible by an intercourse whose character is knowledge.

39.—*Comm.* "Intercourse, produced by Yoga," that is, a special virtue, produced by the practice of Yoga, (the union of the soul with God by means of abstract contemplation,) in accordance with the evidence of the Śruti, the Purāṇas and other authorities.

nected with a predicate in a general proposition. (The knowledge of the Vyāpti.)

67. The reason which is actually known, is not the cause ; in this case, there would be no inference, if the reason had for instance not yet arrived, *or had been destroyed*.

68. Consideration is the knowledge that a subject in its invariable connection with a predicate is united with the place of conclusion (Paksha, subject of the conclusion).

The invariable connection of a subject with a predicate in a general proposition (Vyāpti) is called the non-connexion of the reason (middle term) with any thing different from the subject of the conclusion, (Paksha, minor term.)

40.—*Comm.* Manifestation means the perception of all things, meditation is the thinking of the mind, which is separated from all objects.

41.—*Comm.* "The intercourse as regards inference is consideration."

The special cause (instrumental cause) of an inference is the knowledge of the invariable connection of the subject with the predicate in a general proposition, (आग्निज्ञानं,*) and consideration is the intercourse. For instance, let a man who from the smoke on a hearth, etc. has become aware of the invariable connection of smoke with fire, see afterwards any where on a mountain an uninterrupted line of smoke. He will then re-

* आग्निः (Vyāpti). It is difficult to find an adequate word for this term in English. It means literally, pervading inherence, the inherent and essential presence of any one thing or property in another, (see Wilson's Dict.) but it is used in the Nyāya and other philosophical systems to denote the logical relation of one notion to another in a proposition of such a kind, that under circumstances an inference may be drawn from it; or : it is the relation of the subject to the predicate, and vice versa, as the major proposition of a syllogism. The subject of such a proposition is the आप्यः the notion, which is pervaded by another (by the predicate) that is to say, which is only a part of the predicate, which is less extensive than the latter, or included in it. The subject is therefore invariably connected with the predicate, and if the former is thought, and the latter is thought. The predicate is the आप्यकः, the pervading notion ; it has a greater extent than the subject, and the latter is only a part of it. It is, therefore, not invariably connected with it, and if the predicate is thought, the subject is not necessarily thought with it. The Vyāpti is, accordingly, only understood, if the relation of the two notions, to be connected together, on either part is understood. Further, the Vyāpti is a proposition, from

69. Or the perception of the identity of the reason with the conclusion (predicate of) which is not connected with anything incompatible with the subject of the conclusion. Subject (of conclusion, minor term,) is the certainty of the conclusion where the intention to conclude is not absent.

collect the general proposition, according to which smoke is invariably connected with fire. Hence arises the knowledge, this (mountain) is possessed with smoke which is invariably connected with fire. This (the knowledge, that any subject is connected by the middle term with a general predicate, or the knowledge of the two premises) is consideration. Hence arises the knowledge, this mountain is fiery, which is an inference. The ancients held, that smoke, when actually perceived, together with the notion, that it is invariably connected with fire, is the special cause of a conclusion. This is denied, in the text; for if the reason (लिङ्गं, sign) were the special cause of the conclusion, then inference could not take place, if the reason (sign) had not yet arrived, or had been destroyed, because then the reason, the *pretended* special cause of a conclusion, were not present.

which an inference can be derived, that is to say, it must be a general proposition, fit to form the major proposition of a syllogism. The names of Vyápya, Vyápaka are only used with reference to the general proposition; if a third term (the minor term) is connected with them, they obtain other names, viz., the Vyápya (middle term) the name of हेतुः, reason, argument, or लिङ्गं, sign, and the Vyápaka (major term) the name of साध्यं, conclusion, predicate of the conclusion. The minor term (the subject of the conclusion) is called पदः place (minor term, subject of the conclusion), viz. the place, to be connected by means of the middle term with the major term, or predicate of the conclusion.—If these names in their literal acceptation appear at first curious to a European student and totally deviating from those, used in the logical terminology of the west, it must be borne in mind, that their literal sense does not in the least affect their value as logical terms, and also, that the European names for the same notions are equally figurative, and the names for instance of subordination, co-ordination, subject, predicate, conclusion, &c., but very imperfectly express the logical relation to which they refer. In fact most of these relations are in all languages taken from relations of space, as almost all terms which are of an abstract nature. As the literal translation of Vyápti, Vyápya, &c. might easily lead to false views, I have preferred to give their equivalents in the terminology accepted in Europe.

70.—From the knowledge, that with such a place the reason (middle term) is connected, inference is the consequence.

42.—*Gomm.* "Consideration is the knowledge, that a subject in a general proposition (the reason, the middle term) is united with the subject of conclusion," (terminus minor.)

The knowledge of the determination of the reason (middle term) which is determined by a general predicate, (major term) in connection with the place (minor term) is the special cause of a conclusion. This can be comprehended in a double manner, either, it is the knowledge, that the subject of the general proposition (the middle term) is connected with the place (subject of conclusion, minor term) or, it is the knowledge, that the place (subject of conclusion) is possessed of the subject of the general proposition (middle term.) Accordingly the conclusion takes place either from the knowledge, that the subject of the general proposition (middle term) is connected with the place (subject, minor term) from which follows that the conclusion (predicate of the conclusion, major term) is connected with the place, (minor term,) or it takes place from the knowledge, that the place (minor term) is possessed of the subject of the general proposition (middle term) from which follows, that the place (minor term) is possessed of the conclusion (major term.)

Some think: 'Also from a two-fold consideration ensues the inference, that the place, (subject) is possessed of the conclusion (predicate of.) There is (according to them) no necessity for the knowledge, that the mountain is possessed with smoke, which is invariably connected with fire. First there is the perception, that the mountain smokes; further the recollection arises, that smoke is the subject, with which fire is invariably connected. In this case inference evidently takes place from those two acts of knowledge. A knowledge of something (of the Pakṣa, the minor term) determined by a notion, which is again determined by the predicate (by a notion, determined by the Vyāpti,) can never be the cause, but there takes place the cause by the knowledge, that the place is determined by the general notion of the subject (middle term, for instance a mountain determined by the general notion of smoke) because this is necessary, and because the assumption of a knowledge, determined by what is determined (by the general proposition, by the Vyāpti), has the fault of complication.'

71.—There are 'five semblances of a reason, which are called going astray, contradiction, inconclusiveness, equalization and absurdity.

72.—The fault of going astray is again three-fold, that which is too general, that which is not general enough and non-exclusive.

We deny this; for even if there is no knowledge of the general notion (the class) of the middle term (vyápya, for instance the general notion of fire) the inference takes place from the knowledge, that there is a subject (of conclusion, Paksha) determined by something (middle term) with which fire for instance is invariably connected. And this assumption is also more simple; for the cause takes place by the knowledge, that there is a determination of the subject (of conclusion, Paksha) determined by the predicate of the general proposition (determined by the Vyápti).

Moreover, according to your opinion from the knowledge: "The mountain is smoking," the inference (the mountain is fiery) should follow, because there is a knowledge, that the subject of the conclusion (Paksha) is determined by the general notion (class) of smoke, which in this case is the general notion (class) of the middle term (vyápya) but this of course will not be granted by any one.

And if you further say, 'the cause is the knowledge that the subject (of conclusion, Paksha) is determined by the general notion of the middle term (vyápya) when perceived together with the predicate of the general proposition' (Vyápti) the consequence would be, that an inference would ensue, if Chaitra perceived a subject as invariably connected with a predicate in a general proposition, and Maitra the general notion (attribute, class) in connexion with the subject (of conclusion).

If you lastly assume, 'that the perception of the place, determined by a general notion, by A, in conjunction with the perception of the middle term in its invariable connexion with the major term (the middle term, determined by the Vyápti,) by the same A, is the cause of the conclusion, made by this A,' there would appear an infinite series of causes for the same effect.

According to my opinion, the knowledge of the attribute (middle

73.—It is too 'general,' if applied to the subject (of conclusion) and to an opposite one, not general enough," if excluded from either.

term) of the subject (of conclusion) as determined by the predicate (major term) with which it is invariably connected, takes place through intimate relation, and produces the conclusion by the same relation. In this case an infinite series of causes is avoided. On the contrary, if it is said, that the knowledge of the middle term as invariably connected with a predicate in a general proposition (with the major term, as the Vyāpti) and also the knowledge of the general notion (attribute, middle term) of the subject (of conclusion, minor term, Paksha) are causes, independent of each other, there would be a two-fold state of the cause of the same effect, and a conclusion would follow from the sentences: "There is smoke, which is invariably connected with fire," and: "The mountain is fiery." If this is correct, we may say, that if there is a double knowledge, there must be also a determined knowledge, and here at the end of the discussion, where its result is given, a complication is no fault.

(This is on the whole an excellent exposition of the logical relation of the cause of the conclusion. It is here lucidly explained, in what manner the three notions of a syllogism are in relation to each other, and also, that the cause of the conclusion is not the middle term, as separated from the major term, but only in its connexion with it. As this is sometimes not attended to, it is not superfluous to attach importance to it. At the same time it is true, that the logical form of a syllogism does not consist of one premise, and the conclusion, but of two premises with the conclusion; for if one reflects as to the form, given by our author, viz. the minor term in connexion with the middle term, which is itself determined by the major term, it is evident, that there are two connexions, viz. of the minor term with the middle, and of this with the major. That is to say, there are two propositions or two premises.)

43.—Comm.—Too general is a reason, which abides as well in the subject of the conclusion as in an opposite one. (Subject of the conclusion is, where the major term abides, for instance, if fire is the major, smoke the middle, a mountain or a hearth is the subject of the minor,

74.—Non-exclusive,⁴⁴ when no other subject (of the conclu-

&c. A subject, opposite to the conclusion, is where it does not abide, for instance, in the example above given, a tank is a subject; opposite to the major term.)

That is to say, the reason is too general, when it abides *also* in a subject, where the major term is not found. For instance, let a hearth be the subject (minor term), smoke the major term, and fire the reason, the conclusion would be: the hearth smokes, because it is fiery, which would be false, because the reason is too general; for fire (the reason) is also connected with other subjects, where there is no smoke, for instance, with an iron ball.

(We would not acknowledge this as a logical fallacy, which takes place, when the conclusion does not follow from the premises, but as a fallacy *extra dictionem*, where the matter of the premises is wrong; for the conclusion follows here from the premises. In this instance the major proposition is wrong, which is: where there is fire there is smoke. The conclusion, however, is quite right as well in form as in matter, and the example is therefore not judiciously selected. The fault would, however, be apparent, if iron ball for instance had been taken for the minor term.

As the Nyāya knows only the two first figures of syllogism, and of them only the two moods Barbara and Camestres,* we may say, that the fallacy has arisen by the major proposition being special instead of general.)

44.—*Comm.*—Non-general is the reason, which has no similar subjects of conclusion for the major term† (that is where the major term has only one subject, or where no similar instances can be adduced for the reason.) (Thus says the commentary in explanation of the text.

* In Barbara; it is hardly necessary to say, there are all three propositions general affirmatives, in Camestres the first a general affirmative, the second a general negative and the third a general negative.

† This is much more clearly stated in the *Tarka Sangraha*. I quote the passage in Dr. Ballentyne's translation (*Lectures on the Nyāya philosophy*, p. 41.) "The pretended reason, which applies neither to similar instances nor dissimilar ones, is one devoid of community." As, when one says: "Sound is eternal, for it has the nature of sound." Now the nature of sound resides in sound alone, and is nothing else, whether eternal or uneternal.

sion) is possible. A reason, which does not abide in the subject (of conclusion) is called contradictory."

75.—Three kinds of inconclusiveness are enumerated, viz. in-

The latter, however, is here much clearer than the former, because the question is not, whether the major is immediately found in the minor but whether it is found there by the means of another term; in the first case there would be no necessity for an argument. The example given in the commentary is: Sound is not eternal, because belonging to the class of sound. Here is, according to it, no similar instance, in which the reason (the class of sound) and by it the major is found, as the class of sound abides only in sound, and no where else. We should reject this argument at once, as having only two terms; but the Nyāya is obliged to look out for some other appliance, because class is something different from the objects comprehended by it.)

45.—*Comm.*—Non-exclusive, is a reason, where the major term is the negation of absolute negation (where the major term may be predicated of any other notion). Hereby a general negative is impossible, and a conclusion therefore cannot take place.

(The Bengalee translation gives the following explanation:

"A reason, for which there is only an affirmative, is non-exclusive, that is to say, a reason, whose subject does not exclude any thing, for instance all, &c. Let all be the subject, (minor term) object of proof the major, and fit to be named the reason. This argument is non-exclusive; for here cannot be given a similar instance with regard to the subject (minor term) as it can be given in the argument: "The mountain is fiery, because it smokes;" for here is a similar instance on the part of the subject a hearth, &c. According to the opinion of the modern school a non-exclusive reason takes place, where the major admits of only an affirmative (that is to say, where the major is not excluded from any other notion) for instance in the argument: "A jar is an object of proof, because it can be named.")

(We would not consider either of these conclusions faulty in form, because the middle term is properly connected with either of the extremes. A reason then goes astray, to state it briefly, if the reason is too wide, further if it does not refer to similar instances; and lastly, if it does not refer to dissimilar ones.)

conclusiveness on the part of the subject, inconclusiveness from the nature of the reason, and inconclusiveness from limitation.

76.—Where there is a jewel hill, for instance, subject of the conclusion, there is inconclusiveness on the part of the subject. "Inconclusiveness from the nature of the reason" takes place, for instance, if the substantiality of a tank be inferred from its having the quality of smoke.

77.—Inconclusiveness from limitation" would take place, for

46.—*Comm.*—"A contradictory reason is one which does not abide in the subject of conclusion," (minor term) that is to say, a reason, whose negation is the major term (a reason which is the contrary notion of the major term). Be cow the subject; the notion (class) of cow the major, and the notion of horse the middle term. Here the reason, the notion of horse, excludes the major, the notion of cow, and therefore does not admit of an inference.

(Here the fault again is not in the reasoning, but the major premise is wrong; it is therefore a fallacy extra dictionem.)

47.—*Comm.*—1. Inconclusiveness on the part of the subject is there, where the notion of the subject (the minor term) is impossible. For instance, if it should be inferred, that a golden hill is fiery, the conclusion could not take place, because there is no such thing as a golden hill.

(Here also is the conclusion not wrong, the fault lies in the minor premise, where the subject is a notion, not given by experience; and the fallacy is therefore one extra dictionem.)

48.—*Comm.*—2. Inconclusiveness from the nature of the reason (middle term) takes place, if the reason is not found in the subject, with which a connexion was supposed (if the reason and the subject exclude each other). Let it for instance be argued that a tank is a thing, because it smokes. Tank (or water in the tank) and smoke are contrary notions, and smoke cannot therefore be predicated of a tank.

(Here again lies the fault in the minor premise. We observe, that the second kind of inconclusiveness does not correspond to the first. In the first the minor term was contradictory, and we should therefore have expected, that in the second the reason would have been contradictory.)

instance, if fire should be inferred from blue smoke. Equalization,⁴⁹ is called a consideration from contradictory reasons.

*49.—*Comm.*—3. Inconclusiveness from limitation (on the part of the invariable connexion with the predicate). This can be two-fold, on the part of the subject, and on the part of the predicate.

a. First on the part of the predicate. This takes place, if the predicate is a contradictory notion. For instance if the inference were made, that the mountain has a golden fire, the notion of a golden fire (major term) is contradictory.

(Here the major premise is wrong.)

b. Secondly, on the part of the reason. (This takes place, if the reason is contradictory, for instance, if the argument were the mountain is fiery from golden smoke. The fault is here again in the major premise.)

Others say, that this kind takes place, if the terms are too narrow, as if it should be inferred that the mountain is fiery, because it has blue smoke.

(This division of inconclusiveness is evidently faulty; for the first kind is inconclusive, because the minor term is contradictory, the second, because the middle and minor terms exclude each other. In the third kind two divisions are mixed, in the first of which, both the reason and the major term, are considered as contradictory, in the second the reason and major term are limited in their application by an addition which they ought not to have (in the example the addition of blue).

There are accordingly three different divisions confounded. The first proceeds from contradiction in each of the terms. In this would be included the first member of the author's division, and *a* and *b* of the third, by which it is complete. The second division proceeds from the contradiction of two of the terms; of this only one part has been given in the second member, viz. where the reason and the minor term exclude each other. Of the two other members of this division, the first, where the minor and major terms are contradictory, has not been touched upon, and the second, where the reason and the major term are contradictory, has been given in another place, viz. under the head of contradictory reasons. The third division proceeds from limitation,

78.—Absurdity^o is called the error of stating a subject in which there is not the conclusion; as if, for instance, smell would be inferred to be a quality of a jar, because it was *accidentally* perceived at the time of its production.

79.—If a rustic first sees a Gayal (species of ox), &c. his similar knowledge of cows, &c. is the instrument *to form his notion of a Gayal*.

80.—The recollection of the meaning of a sentence which had been previously pronounced, is called the intercourse *in the comparison*. The result of comparison is the knowledge of the force of the word "Gayal" and similar expressions.

that is to say, where, instead of the notion in its whole extent, only a part of it is connected with the other two notions (in the examples blue smoke, blue fire).

50.—Comm.—"An equalised reason is the consideration of opposite reasons."

An equalised reason takes place, if at the time of the consideration of a reason, invariably connected with the absence of the conclusion (major term) the consideration of a reason occurs with which the conclusion is invariably connected; as for instance, if at the time of consideration of water, &c. which is invariably connected with the absence of fire, there is a consideration of smoke invariably connected with fire.*

51.—Comm.—"Absurdity is, if a subject is without the conclusion," (which is assigned to it.)

Absurdity takes place, if the conclusion does not abide in the subject (minor term) for instance, if at the time of the production of a jar the jar is taken as the subject (minor term) and smell as the conclusion,

* The Tarka Sangraha (B. I. p. 42.) explains this: a counterbalanced reason is that along with which there exists another reason which establishes the non-existence of what is to be proved. As if one should argue, "Sound is eternal, because it is audible," as the nature of sound is (by both parties admitted to be) it might be argued with equal force on the other side, that "Sound is not eternal, because it is a product, as a jar is."

81.—The knowledge of words is the special cause. The knowledge of the meanings of words, is here the intercourse,⁴ and the result is verbal knowledge. The knowledge of the power⁵ of words assists in this act.

there is an absurdity, because at the time of production there is no smell in a jar, &c. for all things are at that time without smell.

52.—*Comm.*—"The knowledge of words* is the special cause; the knowledge of the meanings of the words is here the intercourse and the result is verbal knowledge."

The cause of *verbal knowledge* is not a word, when actually heard; for though there be no word spoken, yet there may be verbal knowledge, for instance, if one who has made a vow not to speak, writes down a Sloka.

53.—*Comm.*—"The knowledge of the meanings of the words is here the intercourse." Intercourse is the recollection of the meanings of the words, produced by the words. Otherwise a person who had a knowledge of words, (who heard words) would have verbal knowledge, if he had obtained the meanings of words by perception or any other evidence. (That is to say, if he heard words, the meanings of which were given to him by perception, inference, etc.; for instance, if he heard the word "tree" while at the same time the meaning of it were conveyed to him by his actually seeing a tree. There would be two kinds of knowledge, independent of each other, and not verbal knowledge which is produced by words alone.) Here it must also be understood, that the effects of words are produced by special relation (वृत्तिः) otherwise the effect of the word "jar" for instance, would be the recollection of ether by intimate relation, and there would be accordingly verbal knowledge of the ether.

Special relation is of two kinds, implication (ellipsis) and power.

The knowledge of the power of a word is necessary; for unless the power of a word is previously apprehended, there cannot be *verbal knowledge* from recollection, which depends upon that relation (power

* A word is a sound which has a power, as for instance, the power of the sound "man" refers to an animal which has hands, feet, &c. The meaning of a word is the object to which it refers, for instance, the meaning of the word "tree" is a thing, which has a trunk, branches, leaves, &c.

of a word) although there may exist a knowledge of the words (the words may be heard). The recollection of the meaning of the knowledge of a word takes place according to the rule of the knowledge of any object which is in relation.

Power is the connexion of the meaning of a word with the same word. That by such or such a sound such or such a meaning is understood, depends upon the will of God. In names, which are at present given, there is also a power, because the rule : "Let the father on the eleventh day (after the birth of a child) give a name to the child," depends on the will of God. In a sign, however, given at present, there is no power. Such is the opinion of some, but the modern school (of the Nyáyaikas) maintain, that the will of God is not the power, but merely will (of man.) Hence is also power in a sign, which may be given at present.

The apprehension of power depends upon grammar, comparison, dictionary, the instruction of persons worthy of confidence, actual intercourse, the supplying of the sentence, substitution, and the connexion with well-known words.

a. The apprehension of the root, of the inflective base, the derivative affixes, &c. of a word is produced by grammar ; it does not take place, whenever there is an obstacle, as there is, if, according to the statement of the grammarians, the power of the grammatical terminations (that is of the verbs and nouns) refers to the agent. In the sentence : "Chaittra cooks" the termination in "cooks" is inseparably connected with the agent "Chaittra."

This connexion, we maintain, does in this case not arise, in consequence of its complication ; but in the action (cooks) the power is produced, because this assumption is simple,* for it is manifest, that the action is a determination of *Chaittra*.

b. The power which takes place by comparison, has been before described.

c. In the same manner power is also apprehended by the dictionary ; if there is, however, any obstacle, it is not apprehended. Thus according to the dictionaries, the adjective terms of "blue," &c. have power with reference to blue colour and to a thing which has

* According to the grammarians it must be said : "Chaittra, not separated from what is determined by the action referring to cooking," while the Nyáyaikas say : "Chaittra, determined by the action, referring to cooking."

blue colour; but it is more simple to say, that this term by its power refers to the quality of blue, and by implication to a thing which has blue colour.*

d. Or the power is derived from the word of a person, worthy of confidence, if for instance it is said, that the word "Pika" (a black cuckoo) is the same as "Kokila," the power of the word "Pika" is apprehended.

e. Or from actual intercourse. If for instance the master who is a grown up person, orders his servant who is also a grown up person, to bring the jar, and the jar is brought by the latter, a boy who attends to this, hence observes that the action of bringing a jar is connected with those words. If he further hears: "Take away the jar," "bring the cow," he understands the power of the term: "jar," &c., to be brought or to be taken away, with reference to a jar, &c. in connexion with an action.

Some say: 'Under this supposition there is no verbal knowledge in the sentence: "There is a blue jar on the ground;" for the power of a jar, &c. is apprehended by a jar, as connected with an action, and the power of any termination of a verb refers to the understanding of an action, but in this case there is no connexion of such a kind, and therefore no verbal knowledge?'

We do not agree, because, although it is at first necessary for brevity's sake to admit a power with reference to a jar, as determined by action, it is right to omit it afterwards.

f. Or from supplying the sentence. (This takes place, if in a sentence a word has a special meaning, while from other sentences it is known, that the meaning is more general.)

g. Or from substitution. Substitution means the definition of the sense of a word by another word of the same sense; thus, if for the word belligerous "warlike" is substituted, the power refers to the word "warlike."†

h. Or from the connexion with well-known words, for instance in the sentence: "In this mango tree the Pika sweetly sings," the power of the word "Pika" is apprehended in this manner.

* If a word has several meanings, there is a separate power for each of them.

† In the original the examples are: "ghaṭa:" and "kalasa," either of which means a jar.

Some (the Mīmāṃsikas) maintain : 'The power of a word refers to the class (notion) and not to the individual, because in the latter case it would go astray, and require assumptions without end. And on the first supposition there is also a knowledge of the individual, because without individuals the knowledge of a class is impossible.'

We deny this, because without assuming a power, the apprehension of an individual does not take place.

Nor does implication (ellipsis) refer to an individual ; for an individual may be apprehended, although there is no want of apprehension of the literal meaning of a word (an implication is dependent on the circumstance, that a word cannot be comprehended in its literal sense.)

Nor need there be any fear, that by assuming a power, referring to an individual, the fault of an infinite number of hypotheses is committed ; for we assume one and the same power for all individuals.

Nor is there (by the assumption, that power refers to the individual) a want of extension ; for this extension is effected by the class of cow for instance (when a cow is the individual).

Moreover, if the power is apprehended for instance 'in cow, possessed' of power, the force refers to an individual. If on the contrary the power is apprehended for instance in the class of cow, then there would be a recollection of the meaning of a word, determined by the class of cow, and a verbal knowledge would be impossible, because the knowledge of the power by the same determination would be the cause of the recollection of the meaning of a word and of verbal knowledge. Moreover, if the power refers to the class of cow, we must declare, that the class of the class of cow is the determination of what is possessed of the power. But the class of cow, which is not in intimate relation to any thing that is not cow, is in intimate relation to all cows. Hence your assumption of a determination of the notion of any thing, possessed of power, is complicated, because this notion does not refer to individual cows ; therefore in order to comprehend this or that individual, possessed of this or that class, it is necessary to assume a power, which is founded on individuals, determined by class and form.

A word, possessed of power, is either Yaugika, or Rūḍha, or Yoga-rūḍha, or Yaugika-rūḍha.

1. A word is Yaugika, if its meaning is understood by the meaning of its parts ; for instance in the word "giver" (in Sanscrit the ex-

82.—Implication, “ is the relation of a word which has power, and it takes place when the intention of the speaker is not understood by the literal meaning of a word. The cause of understanding a sentence is contiguity, consistency, construction and intention.

ample is Pachaka, cook) the root *giv* (*e*) expresses the action give, and the termination “*er*” refers to the agent. And the whole expresses the meanings of the parts, viz. an agent with reference to the action “give.”

2. Rūḍha is a word, which, independent of the power of its parts, is only understood by the power of the whole, as for instance “go” (cow, for “go” is derived from “gam,” to go, which does not express the meaning of go,) “ghaṭa :” (jar) etc.

3. Yogarūḍha is a word, which, beside the power of its parts, expresses a different meaning as a whole, for instance “Pankaja” (from “Panka,” mud, and “ja,” born) for the word “Pankaja” means by the power of its parts “an agent, born in mud” (which includes any thing, produced in such a manner) but by its power as a whole a “waterlily” (that is only one of the things, born in mud).

4. Yaugika-rūḍha is a word, which is understood either by the meaning of its parts, or by Rūḍha, for instance Udbhid. The power of the word “ud” refers to upwards, the power of the root “bhid” to cutting. Therefore by its Yaugika power it refers to tree, and by its power of Rūḍha it refers to any germ, produced from corn.

54.—Comm.—“ Implication is the relation of a word, which has power, and it takes place, when the intention of the speaker is not understood by the literal sense of a word.”

For instance, let the sentence be given : “Ghosha dwells on the Gangá.” If in this case, with reference to the literal meaning of “Gangá,” viz. the current, either the connexion of Ghosha, or the intention of the speaker is not obtained, the meaning of “bank” is understood by implication. This implication is the relation of a word which has power. Here, from the knowledge of the connexion of the literal meaning of the current with the bank, a recollection of the bank is produced, and hence the meaning of the sentence is understood.

Moreover if the want of connexion alone were the cause of implication, there would be no implication in the sentence : “Let the staffs

83.—Contiguity," is called the proximity of words.

"enter," because there is no want of connexion with reference to the entering of the staffs. Therefore, because here the entrance of the staffs has no reference to the intention of the speaker, which is the taking of food, the implication refers to the bearers of staffs. In the same manner, in the sentence: "Protect the ghee from the crows" the word "crow" has an implication to any thing which may injure the ghee, because the intention of the speaker refers to the preservation of the ghee generally. In the same manner, if it is said: "The umbrella-bearers are proceeding;" the word "umbrella-bearers" implies the merchants of a caravan.

This latter is called the implication which does not lose its own meaning (*Ajahatsārthā Lakṣhaṇā*, which keeps its own meaning, beside that which it obtains from implication) because by the term "merchants of a caravan" the bearers of umbrellas as well as those without umbrellas are understood.

Moreover, if the want of sense in the connexion *alone* were the cause of implication, sometimes the word "Gangā" would imply: "bank," sometimes the word: "Ghosha," "fish," &c. and there would be accordingly no rule.* This, however, must be understood: if the connexion of the meaning of a word, possessed of power, is apprehended by the notion of bank, bank must be apprehended by the notion of bank; if, on the other hand, it is apprehended by the notion of the bank of the Gangā, it must be recollected by that notion. Therefore there is no implication in the general notion of an implication, because the general notion is understood without implication. Likewise, there is no power in the general notion of what has power, because any word is able to remind of the meaning of its general notion.

But if there is an implication by the successive connexion of a word, possessed of power, it is called an implied implication, as for instance in the word "Dvirépha" (literally, that which has two wings, figurative, "black bee") the connexion of: "two-winged," refers to "Bhramara" (black bee) that of "Bhramara" to black bee; this is an implied implication.

55.—*Comm.*—Contiguity means proximity, viz. the uninterrupted succession of two or more words which have a connexion among each

other. Therefore there is no verbal knowledge in the words : "The by inhabited was Dévadatta volcano;" but if by a mistake in the proximity no mistake in the verbal understanding is the consequence, it does not matter.

'But in the sentence : "With umbrella, earrings and clothes adorned is Dévadatta," the recollection of the second word destroys the recollection of the first ; accordingly, as there is an interruption, a recollection of the second word is impossible.'

We do not grant this, as by the impressions of each word until the last an uninterrupted recollection of all objects is possible ; for as by several kinds of intercourse one and the same perception arises, so also one and the same recollection arises by several impressions, and the knowledge of the last letter together with the impressions of all words brings *all* to recollection. How could otherwise exist the recollection of any word that has many letters ?

Moreover ; some say, that, as in a field all pigeons are caught in the same net, so by the recollection of all the meanings of words does take place the verbal knowledge of all meanings of words, which is corresponding to the knowledge of the connexion depending upon the object and verb. Others say : if connected with all such words, as are construed, consistent and contiguous, verbal knowledge of all the words (included in the sentence) takes place ; for, they say, after the meaning of the single sentences has been understood, the meaning of the great sentence will be comprehended by the recollection of the meanings of the words. Hence the assumption of a total impression of a word, manifesting all the letters, has been refuted, because by the apprehension of the last letter, together with the impressions of all the preceding letters which (apprehension) manifests the word, the word is apprehended. This must be understood, if it is said : "the door," the meaning of the word is obtained by the knowledge of the word "close," but not by the knowledge of the meaning of such acts as closing, &c., because the actual presence of the meaning of a word, which is produced by a word, is the cause of verbal knowledge. Moreover, as the words denoting action and object, are mutually connected, it is impossible, that there is verbal knowledge without a word, denoting a verb. In the same manner, if it is said : "Of the flowers," it is necessary to assume : "he is desirous," because without this the preposition "of" could not be applied.

Consistency⁶⁶ is the mutual correspondence of the meanings of the words.

84.—Construction,⁶⁷ is the selection of such terminations, without which the meaning of a sentence is unintelligible. Intention,⁶⁸ is based on the wish of the speaker.

56.—*Comm.*—Consistency is the connexion of the meaning of one word with that of another. Accordingly there is no verbal knowledge in such sentences as: "He sprinkles with fire," because there is no meaning in it. If it is objected, 'that previously to the verbal knowledge there is nowhere a knowledge of this consistency, because there is not before a meaning of the sentence,' we reply: there is a knowledge of consistency which is sometimes doubtful, sometimes certain, if there is a recollection of the meanings of the different words. The modern school, however, says, that the knowledge of consistency is no reason of verbal knowledge. If it is said: "He sprinkles with fire," there is no verbal knowledge, because the inconsistency, which is that fire cannot be an instrument in the action of sprinkling, is certainly an obstacle. Because the certainty of its absence is an obstacle only in a knowledge, which is not produced by common intercourse or by special defects, therefore it is proved, that it is an obstacle with reference to verbal knowledge—although it is not proved, that by the late appearance of consistency verbal knowledge is late.

57.—*Comm.*—Construction is the connexion of one word with another, without which the former has no sense. The case, denoting agent, has no connexion without the case, referring to action, and with this the former is construed. In fact, however, the proximity of the cases denoting agent and action, is included in contiguity. Moreover, with reference to the objective case, for instance of jar, the cause is the knowledge of the termination of the second case. Therefore there is no meaning in such sentences as: "The jar is the accusative case," "to bring is an action."

58.—*Comm.*—Intention is the wish of the speaker. Suppose, intention were not a cause of verbal knowledge, and such a sentence as: "Bring the Saindhava" (meaning horse and salt) were pronounced, there would sometimes the meaning of "horse," and sometimes the meaning of "salt," be obtained. It cannot be said, that the circum-

85.—The instrument⁵⁹ in the perception of happiness and other *internal qualities* is the mind.⁶⁰ The atomic nature of the mind is inferred from the fact that several objects of knowledge are not perceived by it at one and the same time.⁶¹

stances, &c. by which the intention is apprehended, are the cause of verbal knowledge, because they are not included in the definition. And if it is said, 'that they are included as being the cause of the knowledge of the intention,' it is simple to say, that the knowledge of the intention is the cause. In this manner, God is assumed for the knowledge of the intention with reference to the Védas. It must not be said, 'that the knowledge of the intention of the teacher is here the cause,' because, at the commencement of the creation there is no teacher. Nor must it be said: 'there is no general conflagration (destruction of the world,) how can therefore be a commencement of creation?' for a general conflagration is proved by the Śāstra. In the same manner is in the sentence of a parrot the knowledge of the intention of God the cause; but in a vile sentence of the parrot the knowledge of the intention of the speaker.

Others say: If there is a word which has different meanings, the knowledge of the intention is sometimes the cause; moreover, in the sentence of a parrot is also verbal understanding without the knowledge of the intention, and with reference to the Védas the meaning is apprehended by the discussions, which are purified by the eternal Mīmāṃsa.

59.—*Comm.*—Intellect was divided into two kinds; viz. apprehension and remembrance (vid. verse 51.) The nature of apprehension has been explained. Remembrance will not be explained, because it is easy to be understood; for the cause of it is a former apprehension. Some say, 'the class (notion) of apprehension is not causality, but the class (notion) of knowledge;* otherwise there would be no remembrance after a remembrance, because the former impression would be destroyed by the remembrance of the common notion. According to my opinion, however, there is by this remembrance through a new impression a new remembrance produced.' This we cannot grant; where after the remembrance of a perception in its totality the remembrance of

* That is to say, apprehension is not the cause of remembrance, but knowledge in general.

86.—Qualities⁶⁰ abide in substances, and are without qualities and actions.

the single objects (constituting a totality) as of cloth, jar, &c. is produced, but so that there is no remembrance of all the objects, there it must be said, that, as the impression of *every single* remembrance is not destroyed, time, or disease, or the last remembrance is the cause of the destruction of the impression. Accordingly, it cannot be said, 'that a gradual remembrance is impossible' nor, 'that by repeated remembrance, a stronger impression is impossible;' for the word "strong" means here what suddenly recalls to mind. It also cannot be said, 'that the cause is knowledge, as there is no alternative;' for if the special attribute is assigned, there is no going astray; but knowledge has the fault of superfluous causality, as it is a general attribute: How could otherwise a stick be the cause of a jar by being turned round, and not as well by its being a substance or having colour? Nor must it be said: 'There is an apprehension, that the intermediate remembrance will go astray, because the impression is destroyed;' for by objecting to assuming an infinite number of impressions and by assuming the destruction of the impression of the last remembrance, a going astray cannot be apprehended.

60.—*Comm.*—The existence of mind is proved by the following inference. The perception of happiness, &c. takes place by an instrument, because the perception is a production, as for instance is the perception by the eye. This instrument is the mind. It cannot be said 'that the perceptions of unhappiness, &c. are produced by other instruments,' because the necessity of only one instrument as cause for all similar perceptions is evident from its simplicity. Thus the mind is proved as being the substrate of contact, which is the non-intimate cause of unhappiness, &c.

61.—*Comm.*—"The atomic nature of the mind is proved from the fact, that several objects of knowledge are not perceived by it at one and the same time."

It is clear from apprehension (perception) that various objects of perception, for instance, objects of the eye, of taste, &c. are not at one and the same time produced; for although there may exist an inter-course of the several senses with these objects, yet knowledge is produced by *only one* sense, because *the mind* is in contact with *only one*

Material qualities¹ are colour, taste, feel, and smell, priority and posteriority,

sense, and it is not produced (at that time) by any other sense, as the mind is not in contact with it. Therefore if the mind were to be comprehended by the notion of a pervading substance, it should be connected with every thing; hence (as this is not the case) it follows, that the mind is not pervading. It must not be said, 'that the knowledge of the mind is late (successive) because at that time the special fate (merit or demerit) which reminds of knowledge, is also late;' for, if this were the case, there would be no necessity for assuming such instruments of knowledge as the eye, &c.

Nor must it be said: 'How can the narrowness of the mind be reconciled with the fact, that at one and the same time a knowledge from different senses exists, for instance at the time when one eats a large cake;' for the mind is some thing very subtle, and is therefore rapidly in contact with various senses, so that different kinds of knowledge may arise in the same imperceptible succession, as the hundred leaves of a lotus are pierced; it is a mere delusion, if several kinds of knowledge appear at the same time.

Nor must it be said, 'that both (the atomic and pervading nature of the mind) is reconciled under the assumption, that the nature of the mind may contract or expand,' because the assumption of many parts subject to destruction, &c. is complicated, and on the other hand, the assumption of a mind without parts is simple.

62.—*Comm.*—"Qualities abide in substances, and are without qualities and actions."

If it is asked, what proof is there for a separate class of quality? The answer is: The causality, found in what is possessed of generality, different from that (generality) referring to substances and actions,* is determined by some attribute, because causality for a thing which is not determined by some attribute, is impossible; but neither the class of colour, &c. nor the class of existence is this determination, because in the first case it would not comprehend enough (all other quali-

* To understand this, it must be recollected, that generality (class) abides in substances, qualities and actions; the generality therefore, different from the class of substance and action, must be that of quality.

87, 88.—Fluidity, gravity, viscosity and velocity.—Merit and demerit, memory, sound, intellect and others of similar nature are called immaterial qualities by philosophers.⁶⁴ Number, quantity, separatedness, conjunction and disjunction are considered qualities of either class.

89.—Conjunction and disjunction, the different numbers from two upwards, separatedness found in two things or more, are qualities which abide not in one and the same thing.

ties being excluded) and in the second it would comprehend too much, (viz., also substances and actions.) Therefore it is contained in the 24 (qualities) and is the class of quality.

"It abides in substances." Although it is not its definition: "to be dependent on substance, because it would be too wide, as including also action and class, yet it is right to say: it is what is possessed of the class different from existence which class is the determination extending as far as substantiality, because the class of quality is the determination, extending as far as substantiality, and quality is what is possessed of this determination. The classes of action and substance are not determinations, extending as far as substantiality, because substantiality and action do not abide in the sky, &c. and the class of the class of substance, and the class of generality (class) are no *real* classes.

"Without qualities." Although action, generality, &c. are also without qualities, yet it must be understood as the absence of qualities, found in the category which is possessed of generality and different from action; for class and the subsequent three categories have no generality (class); action is not different from action, and substance is not without qualities. Therefore this definition is not too wide.

"Without actions" is only said to describe it, not to define it, because it would otherwise be too wide, the ether being also without action.

63.—Material substances are: earth, water, light, air and mind (material according to the Nyāya is that the measure of which has a limit, and for this reason, mind which is an atom, is included in it.)

64.—Immaterial qualities are: merit and demerit, memory, sound, intellect, happiness, unhappiness, desire, aversion, and endeavour (volition). Immaterial substances are: the sky, time, space and soul.

90.—All the remaining qualities⁶⁶ abide only in one thing. Special qualities⁶⁶ are : intellect, pleasure, pain, desire, aversion, endeavour, touch, viscosity, original fluidity,

91.—Fate, memory and sound : General qualities are : number, quantity, separatedness, conjunction and disjunction, priority and posteriority, derived fluidity.

92. 93.—Gravity and velocity. Number, quantity, separatedness, conjunction, and disjunction, priority and posteriority, fluidity and viscosity are perceived by two senses.

Sound, colour, taste, smell and touch, are *respectively* perceived by one of the external senses.

94.—Gravity, fate and memory, transcend the perception of the senses. The special qualities of the pervading substances⁶⁹ are not produced by the qualities of any cause.⁶⁹

65.—*Comm.*—The remaining qualities are : colour, taste, touch, measure which is an unit, separatedness, found only in one individual, priority, posteriority, intellect, happiness, unhappiness, desire, aversion, endeavour, gravity, viscosity, faculty, fate (merit and demerit) and sound.

66.—The special qualities of the earth are : colour, taste, smell and feel ; of the water : colour, taste, feel, viscosity and natural fluidity ; of the light : colour and feel ; of the air : feel ; of the sky : sound ; of the soul : intellect, happiness, unhappiness, desire, aversion, merit, demerit and memory.

67.—*Comm.*—By two senses, viz. by the eye and the skin.

68.—*Comm.*—Qualities of the pervading substances are : intellect, happiness, unhappiness, desire, aversion, endeavour, merit, demerit, memory, and sound.

69.—*Comm.*—“ They are not produced by the qualities of any cause.” Colour, smell, &c. depend upon the quality of the cause (for instance the colour, taste, smell and feel of a jar depend upon the same qualities of the two halves, of which it is formed) the same cannot be admitted with regard to intellect, &c. because there is no cause of the soul, the ether, &c.

95. 96.—Natural colour, taste, smell, feel, likewise fluidity, viscosity, velocity, gravity, unity, separatedness found in individuals, quantity and elasticity are produced from the qualities of causes. Conjunction, disjunction and velocity are effected by actions.

97.—Colour, taste, smell, touch, quantity, unity, separatedness found in individuals, viscosity and sound are non-intimate causes,

98.—Special qualities of the soul have only instrumental causality. Hot feel, gravity, velocity, fluidity, conjunction and disjunction and the other qualities denoting two extremes, are of two fold causality.⁶⁹

99.—The special qualities of pervading substances, as well as conjunction and disjunction and other qualities denoting two extremes,* are limited.

100.—Colour is perceived by the eye, it manifests substances, *qualities and classes*, it is the cause of the perception of the eye, and is white, &c., according to the variety of colours.

101.—It is eternal in the atoms of water and *light*,⁷⁰ in all other substances it has a cause. Taste is perceived by the tongue; it is various, as sweet, bitter etc.

(The special qualities of the soul are only instrumental causes; for intellect, &c. is not the non-intimate cause of any thing; but the knowledge of what is possible by action is the instrumental cause of the desire of action.)

69.—*Comm.*—Viz. the instrumental and non-intimate causes.

70.—*Comm.*—“Colour is eternal in the atoms of water and light,” because it is there from their nature, non-eternal in the atoms of earth, as by the process of cooking another colour is produced.

* The second distich of this verse in the former edition has been omitted, the whole context showing that it is an interpolation. The same has been done with the first distich of verse 68, for the same reason, so that the present edition contains one verse less than the former.

102.—Its instrument (organ) is the tongue ; as regards eternity, &c. it is like colour." Smell is perceived by the nose, it is the cause of perception through the nose.

103.—There are two kinds of smell, good and bad."

Feel is perceived by the skin, it is the cause of perception through the skin.

104.—It is threefold, tepid, cold and warm. Hardness and similar qualities are in the earth ; with regard to its eternity, the same holds good as above."

105.—These "qualities" as abiding in earth, are produced by cooking, while this is not the case as regards the other elements. The change produced by cooking takes place according to the opinion of the Vaiseshikas" in the single atoms.

71.—*Comm.*—Taste is eternal in the atoms of water, all other taste is non-eternal.

72.—*Comm.*—Smell is non-eternal (because it abides alone in earth, and in the atoms of earth another smell is produced by the process of cooking.)

73.—*Comm.*—The feel of earth and air is temperate, of water cold, and of light hot... Feel is eternal in the atoms of water, light and air, non-eternal in the atoms of earth, (for the same reason as before.)

74.—*Comm.*—These, viz. colour, taste, smell and feel. As abiding in earth, they are produced by a cause, because by the union with fire, the colour, taste, smell and feel of earth are changed ; not so as abiding in water, &c. for although water, &c. be a hundred times boiled, yet no change of its colour, &c. takes place. The smell and heat of water, on the other hand, are artificial, because they are present or absent by the presence or absence of artificial means, like the cold feel of air and earth.

75.—*Comm.*—The Vaiseshikas say, that as to earth the change by the process of cooking takes place in the atoms. Their view is, as follows. As long as the parts are retained in the compound, no change by the process of cooking is possible ; but when by the union of fire the compound substances have been destroyed, that change takes place in the

atoms which have become independent of each other. And again by the union of the atoms which have been changed by the process of cooking, a production is effected from the compound of two, three, &c. atoms again to a compound of many parts; for by the extraordinary velocity of heat the transition from the destruction of one compound to the production of another is sudden. Then from the destruction of a compound of two atoms by a new production a compound, possessed of shape, &c. is formed in a few moments.

For the instruction of the student an explanation of this topic is here given.

The Sūtra of the Vaisēshikās is as follows: "Action is a cause which is independent of conjunction and disjunction:" which means, that its consequent state is independent of its antecedent state; otherwise, as the action also produces the consequent conjunction, there would be the fault of too wide a definition, because the action would depend upon the destruction of the antecedent conjunction.

If here a disjunction, produced by disjunction, is not acknowledged, nine moments are required. If it is acknowledged, the disjunction, depending upon something produces disjunction; but if the cause is something independent, action takes place. If there is a disjunction produced by disjunction, as depending upon the time, which is determined by the destruction of the conjunction, forming the first elements of a compound substance commencing perceptible substances (for which a compound of three atoms is required) ten moments are necessary. If further the disjunction produced by disjunction depends upon the time or upon part (of a compound) either of which is determined by the destruction of a substance, eleven moments are necessary.

1. Nine moments.

From the conjunction of fire there takes place action in the atom, hence disjunction from another atom, hence the destruction of the conjunction, forming the first elements of a compound substance (which consists of three atoms,) hence 1. the destruction of the compound of two atoms, hence 2. the destruction of the quality of blue, &c. in the atom, hence 3. the production of the quality of red, &c., hence 4. the action in accordance with the production of the first elements of things, hence 5. disjunction, hence 6. destruction of the former conjunction, hence 7. the conjunction, by which the first elements of a com-

pound are formed, hence 8. the production of a compound of two atoms, and hence 9. the production of the quality of red, &c.

If it is objected, 'that in the moment, when the quality of blue is destroyed, or in the moment, when the quality of red is produced, there is in the atom the action, in accordance with the production of the first elements of a compound substance;' we deny this, because in an atom, previous to the destruction of the action which takes place in an atom that is united with fire, and also previous to the production of a quality, there is no other action with regard to the atom possible; for *we hold the principle, that in a thing where there is an action, no other action is possible*, and also, that in a substance without quality an action, in accordance with production of the first elements of substances, cannot take place.

Nor can in an atom at the same time that the quality of blue, &c. is removed, the quality of red be produced, because the destruction of the antecedent is the cause of the consequent colour, etc.

2. Ten moments. They take place, if by disjunction, depending upon a time, determined by the destruction of the conjunction, forming the first elements of a compound substance, another disjunction is effected.

From the conjunction of fire there takes place action in the atom, which is the element of a compound of two atoms, hence disjunction, hence the destruction of the conjunction, by which the first elements of a compound are formed, hence 1. the destruction of the compound of two atoms and the disjunction, produced by disjunction, hence 2. the destruction of the quality of blue and the destruction of the former conjunction, hence 3. the production of the quality of red and the consequent conjunction, hence 4. the destruction of the action, produced by the conjunction* of the fire, with regard to the atom, hence 5. the action, in accordance with the production of the first elements of a compound substance, like the conjunction of fate with the soul, hence 6. disjunction, hence 7. the destruction of the former conjunction, hence 8. the conjunction, forming the first elements of a compound substance, hence 9. the production of a compound of two atoms, and hence 10. the production of the quality of red, &c.

3. Eleven moments.

* Nodnam means a conjunction, by which no sound is produced. See v. 119.

From the conjunction of fire there takes place action in the atom, hence disjunction, hence the destruction of the conjunction, forming the first elements of a compound substance, hence 1. the destruction of a compound of two atoms, hence 2. disjunction, produced by disjunction, depending upon a time determined by the destruction of a compound of two atoms, hence 3. the destruction of the former conjunction, hence 4. the consequent conjunction, hence 5. the destruction of the action with reference to the atom, hence 6. the action, forming the first elements of a compound substance, like the conjunction of fate with the soul, hence 7. disjunction, hence 8. the destruction of the former conjunction, hence 9. the conjunction forming the first elements of a compound substance, hence 10. the compound of two atoms, hence 11. the production of the quality of red. One and the same conjunction of fire destroys not the *blue* colour and produces the red colour, as the intermediate sound destroys the preceding and produces the subsequent sound; for one and the same fire continues not for the whole time. Moreover, if the cause of the production were also the cause of destruction, then, if by the destruction of the colour &c. the fire were also destroyed, the atom would remain for a long time without colour. If on the other hand, the cause of destruction were also the cause of production, then, if at the production of the red colour the fire (the cause of the production) were destroyed, there could not be produced the red colour.

If in this manner the action is considered in another atom, the quality is produced in five and more moments.

In five moments. The action takes place in one atom, hence disjunction, hence destruction of the conjunction, forming the first elements of a compound substance, and action in another atom, hence destruction of the compound of two atoms, and disjunction, produced by action in another atom. This is one time. Hence destruction of blue, &c. and from the disjunction the destruction of the former conjunction. This is the second time. Hence the production of the red, and the conjunction, forming the first elements of a compound. This is the third time. Hence the production of the compound of two atoms, which is the fourth time, and hence the production of the red, which is the fifth time.—If one considers the destruction of the substance at the same time with the action in another atom, then the production of

106.—While the Naiyāyikas affirm,¹⁶ that change is effected also in two or more atoms, The cause as regards the operation of counting, is called number."

107.—Eternal unity is attributed to eternal substances, transient unity to transient substances."¹⁷ Numbers from two upwards to an indefinite number are produced by comprehending intellect,

the quality takes place in six moments. In this manner. By the action in one atom disjunction takes place in another atom, hence destruction of the conjunction, forming the first elements of a compound, hence destruction of the compound of two atoms, and action in another atom, hence destruction of the blue and disjunction, produced by action in another atom, hence production of the red, and destruction of the former conjunction in another atom, hence conjunction in another atom, hence production of the compound of two atoms, then production of the red. In the same manner seven moments are required, if one at the time of the destruction of the blue considers the action in another atom, and eight moments, if one considers the production of the red at the same time with the action in another atom.

76.—*Comm.*—"While the Naiyāyikas affirm." It is the opinion of the Naiyāyikas, that also in compounds, viz. in compounds of two, three, &c. atoms, change by the process of cooking takes place. Their view is this. As compound substances have pores, the minute parts of fire enter into the inside, and therefore change by the process of cooking is possible, although the parts be retained in the compound. The opinion of Vaiśeṣhikas is complicated, as it assumes the destruction of an infinite number of parts. If this is the case, the recognition: "this is that jar," is consistent; but where there is no recognition, there we can admit a destruction of the compound.

77.—*Comm.*—"The cause as regards the operation of counting, is called number." The cause, viz., the non-intimate cause.

78.—*Comm.*—"Eternal unity is attributed to eternal substances, transient to transient substances." Eternal substances are the atoms of material substances, further time, space and soul, transient substances for instance a jar, &c. .

108.—And they are collectively apprehended in their dependance upon more than one object.¹⁹ "The comprehending intellect being destroyed, those numbers are also destroyed."

79.—*Comm.*—"Numbers from two upwards to an indefinite number are produced by comprehending intellect, and they are collectively apprehended in their dependance upon more than one object."

Numbers from two upwards, depending upon the addition of one to one, are produced by comprehending intellect.

Although the relation, indicating the class of two, three, &c. abides for instance in each of two, three, &c. jars &c. yet as there is not a knowledge, that one is two, and further as there is the knowledge, that one is not two, it must be assumed a relation, indicating the collective apprehension of two, three, &c. which depends upon more than one object.

80.—*Comm.*—"The comprehending intellect being destroyed, those numbers, (from two upwards) are also destroyed." First there is the comprehending intellect, then the production of the class of two, &c. then the determining knowledge, viz. the determination of the class of two, then the perception determined by the class of two. If the comprehending intellect is destroyed, also the class of two is destroyed.

Although no other knowledge does continue for three moments, because the special qualities of the respective pervading substances are destroyed by the qualities succeeding to them,* yet it must be assumed, that the comprehending intellect continues for three moments; otherwise the comprehending intellect would be destroyed at the time of determination, and thereby also the class of two, three, &c.; for there would be no perception of the class of two, because no object were present, and only when it is present, a knowledge is produced by the eye, &c. Therefore it must be assumed, that the perception of the class of two destroys the comprehending intellect.

It must not be asked, 'how by the destruction of the comprehending intellect the class of two, &c. is destroyed,' because at another time there is no perception of the class of two; for it is clear, that the

* For instance a sound by another, which follows it, or a perception, thought, etc. by a succeeding one.

109.—Comprehending intellect is called the intellect which refers to many unities."¹ Quantity is the cause of the operation of measuring."²

110.—Point (atom of space) length, thickness, breadth, are the differences of quantity; in transient things it is transient, in eternal things eternal."³

comprehending intellect is the cause of those numbers, and its destruction destroys also them. Therefore the class of two, produced by the comprehending intellect of A, is comprehended by the same A.

Nor must it be said, "that the comprehending intellect is the cause of the perception of the class of two," &c., because it is right for brevity's sake to assign it as the cause of the class of two, &c.

The comprehending intellect of the Yogis refers to compounds of two atoms, &c. which transcend the perception of the senses. The comprehending intellect of God (Īśvara) or of the Yogis abiding in the mundane egg, refers to the atoms at the time of the creation of the world.

81.—*Comm.*—"Comprehending intellect is called the intellect which refers to many unities."

This is the intellect, which apprehends, that this is one, this is one, &c. It must be understood, that, where there is a knowledge of undefined unities, there is produced the number, referring to many, different from two, three, &c. as where there is a forest, an army, &c. This is the opinion of Kandalī-kāra. The Āchāryas, however, think, that the class of many, is the class of three, &c. Therefore the class of many includes the class of three, &c. Although the class of three, &c. is included, in an army, yet the class of the class of three, etc. is not apprehended, because this would be wrong. If this is the case, the notion is possible, that this army is greater than that, because if the class of many were without number, there could not exist the notion of a comparative and superlative degree.

82.—*Comm.*—"Quantity is the cause of the operation of measuring," viz. the non-intimate cause

83.—"In transient things it is transient," viz. in a compound of two atoms, &c. "In eternal things it is eternal," viz. is the sky, &c.

111.—Transient quantity is produced from number, measure, and heaps. Quantity found in two, and more atoms arises from number;*

112.—As met with in a jar and similar *extended* things it arises from measure; the conjunction of so called loose things, it is a heap. By this (conjunction)

113.—Measure is produced in such things for instance as cotton. If the place, upon which it (the measure) depends, is destroyed, it is also destroyed. Separatedness which 'is like number' is the cause of the knowledge of separate things.

114.—It cannot be said, that it is included in mutual negation; for it is not the same to say, "this is different from that," and, "this is not that."

115.—Conjunction is called the obtaining of two things unobtained before. It is threefold, the first kind is produced from the action of one of two;

84.—*Comm.*—"Quantity found in two and more atoms." The measure of one atom is not the cause with regard to the measure of a compound of two atoms, nor a compound of two atoms the cause with regard to the measure of a compound of three atoms, because a measure produces a measure which is greater than its own kind.* But the measure of a compound of two atoms is not greater than one atom, and the measure of a compound of three atoms has nothing of its own kind; therefore the non-intimate cause of a compound of two atoms is the number of two in an atom, and of a compound of three atoms the number of three in a compound of two atoms.

85.—*Comm.*—"Separatedness which like number," viz. the non-intimate cause of the knowledge of separatedness is separatedness. It is like number in its relation to eternal and transient things; viz. as the class of unity is eternal in eternal things, and transient in transient things, as transient unity is produced in the second moment after the production of the thing upon which it depends, and is destroyed, when this is destroyed, so the same must be understood with regard to separatedness of two, three, &c.

* Vid. p. 8.

116.—The second from the united action of both, the third from conjunction. Of the first is an instance that of the falcon and the rock.

117.—Of the second, the fighting of two rams ; of the third, the conjunction of the tree and the jar which is produced by the conjunction of the tree with one half of the jar.

118.—The conjunction which is effected by action is again two-fold, the one effected by violent, the other by soft motion ; the first is the cause of sound.

119.—The second is not the cause of sound. Disjunction comprehends also three kinds. The one is produced by the action of one, the second by the action of two,

120.—The third by disjunction. This latter is again of two kinds ; the one arises by the disjunction of the cause only, the other by the disjunction of the cause and non-cause.*

86.—*Comm.*—With regard to the two first kinds of disjunction, the same examples are to be understood as with regard to the two first kinds of conjunction. The third is again two-fold, viz. as produced either by the disjunction of the cause, or by the disjunction of the cause and non-cause.

Where there is an action with regard to one half of a jar, there ensues a disjunction of the two halves, hence the destruction of the conjunction forming the jar, hence destruction of the jar, hence by the action, which consists in the disjunction of the half, the disjunction of the half of the jar from the other part of space, hence a destruction of the conjunction with the other part of space, hence the conjunction with another part of space, hence the destruction of the action.....

Where by an action of the hand, a separation of the tree and the hand takes place, there arises the belief that the tree is also separated from the body. Here in the separation of the body from the tree is the action of the hand not the cause, because they are not at one and the same place. Again there is no action in the body, as the action of a compound is regulated by the actions of each of its parts ; therefore is here produced by the disjunction of cause* and non-cause also a disjunction of effect and non-effect.

* Cause, as it appears, is here the tree.

121.—Posteriority and priority are two-fold with regard to time, or to space, and are only applicable to material bodies.

122.—Posteriority of place (distance) is perceived from a greater space intervening between the conjunction of the sun, priority (nearness) by the perception of less space.

123.—The non-intimate cause of them is conjunction of space which is the substrate of them.* Posteriority with regard to time is produced by the knowledge of the anterior existence of the revolutions of the sun.

124.—Priority (recent time) from the knowledge of what succeeded the former. The non-intimate cause of them is the conjunction of things which age in time.

125.—If the comprehending intellect were destroyed, posteriority and priority would also be destroyed. Intellect has been previously nearly explained.

126.—What is left, will now be explained. Knowledge is two-fold, wrong notion and right notion.

127.—A knowledge, which manifests something where this something is not present, is a wrong notion." Of this there are two kinds, mistake and doubt.

128.—The former is the certain knowledge of a thing where such a thing is not present, as for instance, the notion of the soul in the body, or yellow colour in a shell.

129.—Doubt" is a knowledge *in question*, whether for in-

87.—*Comm.*—If a knowledge, which manifests something, is transferred to something else, and represents itself at the same time as certain, it is error; for instance, if the knowledge of the soul in such sentences as: "I am reddish," &c., is transferred to the body, or yellow colour to a shell.

88.—*Comm.*—Doubt is a knowledge, determined by the contradictory absence or presence (of a predicate) in one and the same subject.

• Their substrate is: near or far with regard to space.

stance a thing is a man or a trunk. A knowledge which does not manifest something, where this something is not present, but, which manifests this something alone, is certitude.

130.—The apprehension of absence and presence in one and the same object is doubt. The cause of doubt is the knowledge of a general attribute, &c."

(The Bengalee Translation explains this as follows: A doubt is a knowledge such as this: Is this a man or a trunk? This kind of doubt is called a doubt of four extremes (चारैक्यद्वय) because there are four extremes, viz. the notions of a man and non-man, and the notions of trunk and non-trunk. The contradictory notions of presence and absence are called extremes. If it is questioned, whether the mountain is fiery or not fiery, the doubt is, whether one of the two extremes fiery or not fiery abides in the mountain.)

89.—Comm.—There are three causes of doubt.

1. Cause of doubt is the knowledge of a general attribute which is found in two extremes, for instance the notion of height, found in trunk and non-trunk, as if it is doubted, whether this is a trunk or not a trunk.

2. Cause of doubt is a non-general (special) attribute. (Non-general is a predicate, which is not found in the subject of the two extremes;) for instance, if the notion of sound, which is separated from the notions of eternal and non-eternal, (that is the notion of sound is not the general notion, under which eternal and non-eternal are comprehended) is conceived in sound; the doubt arises, whether sound is eternal or non-eternal.

3. Cause of doubt is contradiction (of two extremes,) but not the contradiction, referring to the mere sound alone, because a knowledge of a general predicate of sound is the cause of certitude only; for instance, if it is said: Sound is eternal, sound is not eternal, but the knowledge of the two extremes, which is produced by sound. The doubt takes place by the mind.

In the same way, if there is a doubt, that a knowledge is proved, there is also a doubt with regard to the object of the knowledge.

In the same way, if there is a doubt with regard to a subject in its

131.—Defect? produces wrong notion, excellence right notion. There are different kinds of defects as bile, distance, &c.

132.—Excellence as regards perception is the intercourse of a sense with what is determinable, determined by its determination. Excellence as regards inference

invariable connexion with a predicate, there is also a doubt with regard to the predicate. But the cause of doubt is the knowledge of a subject, determined by an attribute, or the intercourse of a sense with such a subject.

90.—*Comm.*—Defect is the cause of wrong notion, and excellence of right notion.* Defects as for instance, bile, &c. are only of a contingent nature; for their causality is established by the argument from a general affirmative and a general negative (Anwaya and Vyatirēka; if the defect is there, the notion is wrong, if the defect is not there, the notion is not wrong). That excellence is the cause of right notion, on the other hand, is established by *simple* inference; for right notion is produced by a cause, different from the general cause of knowledge, because it is a knowledge that is produced, as wrong notion is. It cannot be said, 'that the absence of defects is the cause.' In the sentence, "the shell is yellow," bile is the defect; from this the right notion of shell is not obtained, because there is no authority to ascribe it more to the one member of the alternative than to the other, and it is right to assume a causality from one excellence in preference to a causality from the absence of numerous defects.

Nor can it be said: 'Let excellence even be granted, there is no perception of white colour in a shell, as bile is an obstacle to it; therefore the causality of the absence of defects, as for instance of bile, is necessary. Of what use is then the assumption of a causality of excellence?' for in this case the causality of excellence is proved by the argument of a general affirmative and negative. In the same way it is well said, that the absence of excellence is the cause of error.

What are those defects? "Bile," &c. Sometimes bile is a defect, when a yellow colour is mistaken for a white one (as in jaundice) sometimes distance, for instance if the moon, sun, &c. by their distance are mistaken for small bodies.

133.—Is the consideration connected with the place, (subject of conclusion) which is determined by the conclusion. Excellence, as regards comparison, is the knowledge of similar objects, derived from words possessed of power.

134.—Excellence as regards verbal knowledge is the right notion of consistency or of the intention. Right notion is a knowledge without error."

135.—Or right notion is a knowledge which is of such a kind and accordingly predicated. A knowledge which is undetermined, is neither right notion nor error ;

136.—For that which is without determination *and determinability* is not comprehended under any relation. Right notion is not perceived by itself, but by the concurrence of doubt."

91.—*Comm.*—"Right knowledge is a knowledge without error." As here the objection might be made, that,—if at the perception of silver and tin, both, silver and tin, are considered as silver,—also on the part of the silver a wrong notion is produced, because that knowledge is not free from error, a second definition is given : "Right notion is a knowledge which is of such a kind, and accordingly predicated." Here it must be understood, that, under which relation the right notion is perceived, under the same relation must be perceived that which is determined, and also the determination. Hence it is not against this definition, if a jar, &c. is comprehended by the same conjunction as the two halves of which it is composed, If this is the case, any thing without determination is no right notion, as there is no general notion, by which it is determined. A notion which is undetermined, is neither true, nor false.

92.—*Comm.*—"Right notion is not perceived by itself, but by the concurrence of doubt."

Namely, the Mīmāṃsakas say, that right notion is comprehended by itself. According to the Gurus* a knowledge is a right notion by its

* Col. Misc. Essays, Vol. I. p. 298. Next to him (Bhaṭṭa Kumārilaśwami) is a writer usually cited under the title of Guru, more rarely under the designation of Prabhākara. His work I had no opportunity of examining with a view to the present

187.—The cause of the apprehension of a general proposition is the non-apprehension of what goes astray and the apprehen-

own manifestation. (Bengalee Tr. They state the object of knowledge, for instance of a jar, to be three-fold, viz. the jar, the soul, and the knowledge of a jar &c. in connexion with that which is to be proved, because by the means of object of the knowledge, for instance of a jar, first the jar, further the soul, and lastly, the knowledge of the jar in connexion with that which is to be proved, form one and the same knowledge, which may be pronounced in the sentence: "I know the jar," which means, I have a knowledge, which manifests a jar, &c.)

According to the opinion of the Bhaṭṭas* knowledge is beyond the senses; the notion (class) of knowledge, produced by that knowledge (which is beyond the senses) is perceptible; by this (notion) knowledge is inferred (B. T. According to the Bhaṭṭas knowledge, without determination as well as with determination, is beyond the senses; but after the knowledge of a jar there arises the notion of what is known with reference to the jar, &c. then the notion of what is known, viz. by me the jar is known, is perceived, and lastly, "I have a knowledge of a jar," &c. determined by the notion of a jar, &c.)

According to the opinion of the Mūrārimisras knowledge is obtained by reflection (B. T. the Mūrārimisras say, that, after the knowledge

essay, and he is known to me chiefly from reference and quotations; as in Mādhava's summary, where his opinions are perpetually contrasted with Kumārila's, and in the text and commentary of Śāstra-dīpikā, where his positions are canvassed with those of numerous other writers.

* Id, p. 297. The annotations (Vārtika to the Commentary of the Sūtras of the Mīmāṃsā, by Sabaraswāmī) are by Bhaṭṭa Kumārilaśwāmī, who is the great authority of the Mīmāṃsukā school, in which he is emphatically designated by his title, Bhaṭṭa, equivalent to Doctor. He frequently expounds and corrects Sabara's gloss, often delivers a different interpretation, &c. . . . Id. 298. Kumārila Bhaṭṭa figures greatly in the traditional religious history of India. He was predecessor of Sankara Achārya, and equally rigid in maintaining the orthodox faith against heretics, who reject the authority of the Vēdas. He is considered to have been the chief antagonist of the sect of Buddha, and to have instigated an exterminating persecution of that heresy The age of Kumārila, anterior to Sankara, and corresponding with the period of the persecution of the Bauddhas, goes back to an antiquity of much more than a thousand year.

sion of what does not go astray ; sometimes doubt is removed by discussion.*

of a jar, &c. there is the reflection, I know the jar, by this there is a knowledge, manifesting the knowledge of a jar, &c.)

According to the opinion of all of them this or the other knowledge is right notion by a knowledge, manifesting this or the other knowledge ; for knowledge is to be ascertained by its object ; therefore the object is to be known by the knowledge of knowledge. This opinion is blamed in the text : " Right notion is not perceived by itself," &c. If right notion of knowledge were comprehended by itself, there would be no doubt with regard to knowledge, produced by practice ; for if in this case knowledge is known, also its right notion (evidence) is known ; hence how could doubt exist ? On the other hand, if knowledge is not known, then, in the absence of the knowledge of something determined by an attribute, how can doubt arise ? Therefore right knowledge is an object of inference ; for instance : This knowledge is right notion, because it is produced by the agreement of those who discuss on it. That, which is not of such a kind, is not of such a kind, as wrong notion. For instance : This knowledge, the general notion of earth, is right notion, because the notion of knowledge, representing the general notion of earth, is found in that which has smell. In the same manner this knowledge of water is right notion, because the general notion of knowledge, representing the general notion of water, is found in that which has viscosity.

93.—*Comm.*—"The cause of the apprehension of a general proposition (Vyāpti, the invariable connexion of a subject with a predicate) is the non-apprehension of what goes astray, and the apprehension of what does not go astray ; sometimes a doubt is removed by discussion."

The invariable connexion of a subject with a predicate (Vyāpti) has been before explained, but not the means of its apprehension. This is now done in the text, viz: "The cause," &c. 1st, The non-apprehension of what goes astray* is the cause, since, if this apprehension takes place, the general proposition (Vyāpti) cannot be apprehended. The apprehension of what does not go astray (of similar instances) is the

* Vyabhichāra : a reason goes astray, if it is connected with any subject, where the conclusion (major term) cannot abide. Sahachāra ; a reason does not go astray, if it has similar instances, in which the conclusion abides.

138.—Specification is an attribute which is contained in the conclusion, but not in the reason.* Its chief points will now be explained.

cause, as proved by the argument from a general affirmative and a general negative (Anwaya Vyatiréka, if there are similar instances, there is also the general proposition; if there are no similar instances, there is no general proposition). Repetition (the repetition of similar instances) is no cause, since, although there be not an apprehension of what goes astray, yet the general proposition (Vyápti) is sometimes at once apprehended. Sometimes, however, repetition is required to remove a doubt with reference to what goes astray. Where by repetition the doubt does not disappear, discussion is required to guard against the contrary supposition. For instance, if there is a doubt, whether smoke be not also found with something, where there is no fire, this doubt is removed by the consideration, that fire and smoke are in the relation of cause and effect. If this mountain is without fire, it must also be without smoke, because an effect is not without its cause. If it is sometimes without cause, it is an effect without cause. In this case doubt arises, which is to be removed from its obstacle, in such a manner: If an effect is without cause, fire is not the invariable means to produce smoke, or food to satisfy hunger. Where doubt does not of itself arise, there discussion is not necessary. With this view it is said in the text: "Sometimes doubt is removed by discussion."*

94.—Comm.—"Specification is an attribute, which is contained in its conclusion, (major term) but not in its reason."

"If this definition is correct, then in the inference: "This man is black, because he is the son of Mitrá," the notion of the origin of black colour by her eating bad vegetables, would be no specification, because

* The Bengalee Translator says in illustration of this: For instance if hearth is the subject (minor term), smoke the conclusion (major term), and fire the reason (middle term), then is wet fuel the specification with regard to the faulty reason, viz. fire, because it is the condition of smoke, but not of fire; for where there is smoke, there is necessarily also wet fuel; but where there is fire, there is not (necessarily) wet fuel, as for instance a fiery iron-ball; on the other hand, if there is a faultless reason, for instance, if mountain is the subject, fire the conclusion, and smoke the reason, there is no specification, because the attribute, which is a condition of the conclusion, is also a condition of the reason.

139.—All admissible specifications abide in the same place with the conclusion.* Those, which abide in the same place with the reason, go astray with regard to the conclusion.

it is not contained in the conclusion ; (black) for blackness is also found in a jar, &c.

Further : In the inference : “ Air is perceptible ” because it is the site of touch, the notion of proportionate greatness, would be no specification, because perception takes place also with regard to the soul, &c. where there is no greatness.

‘ Nor would the notion of existence (भावत्वं,) be a specification in the inference : “ Destruction is transient from its being a production,” because the notion of something transient is also in antecedent negation, and here, without any doubt, is not existence.’

We deny this ; for the meaning is, that the specification, which is a condition of the conclusion, as determined by this or that attribute, is not a condition of the reason, as determined by the same attribute ; thus for instance the notion of a production by bad vegetables is the condition of the blackness, which is determined by the notion of son of Mitrá. In the same manner is proportionate greatness the condition of the perception, determined by the notion of external things. Thus in the inference : “ Destruction is transient from its being a production,” is the notion of existence the condition of the conclusion, as determined by the notion of production.

In a faultless reason, there is no such attribute, viz. something, being a condition of a determined conclusion (major term), while it is not a condition of the reason under the same determination. But in a reason which goes astray, one of the two at least takes place, either that the place of the specification, which is also the place of the conclusion (major term) is the condition of the conclusion and the non-condition of the reason, or that the place, where there is not the specification, which is also the place, determining the absence of the conclusion, is the condition of the conclusion, and the non-condition of the reason.

95.—Comm.—“ Specification is necessary to judge, where a reason goes astray.” That is to say, the assumption of specification is necessary to infer, that the conclusion goes astray, which takes place by the

140.—Specification is necessary to judge, where a reason goes astray.⁹⁵ It is the opinion of the Vaiseshikas that verbal

specification going astray. Therefore, where there is a specification which is the condition of a conclusion without any further addition, there by the going astray of the specification which has no further addition, may be concluded also the going astray of the conclusion. For instance, where it is concluded that something smokes, from fire, there fire (as the reason of smoke) goes astray with regard to smoke, because wet fuel goes astray; for, if the more comprehensive notion goes astray, it is necessary that also the more narrow notion goes astray. But where the specification is of such a kind, as to be a condition of the conclusion (major term) as determined by any attribute (addition) how insignificant soever, there the inference, that the conclusion goes astray, follows from the going astray of the specification in a subject, determined by such an attribute (addition.) for instance, if it is inferred, that this person is black, because he is the son of Mitrá, the notion: "a son of Mitrá" goes astray with regard to blackness, because with regard to the son of Mitrá, goes astray the specification of a product of bad vegetables.

96.—*Comm.*—"Verbal knowledge and comparison are not different kinds of proof."

According to the opinion of the Vaiseshikas there are only two kinds of knowledge, viz. perception and inference, verbal knowledge and comparison being included in the latter; for such sentences as: "Drive the cow away by the stick," or Vedaic sentences, depend upon the knowledge of the connexion of the meanings of the words, which are recollected by the object the speaker has in view, because all the words, which form a sentence, have intention, consistency, &c., as in the sentence: "Bring the jar," &c.—Or: These meanings of words are mutually connected, because the words have consistency, &c., like similar meanings of words. The same is the case with regard to comparison. When a Gayal has been perceived, the word Gayal is the cause of the power with reference to what is determined by the notion of Gayal, because the old have attached this meaning to it, no other kind of proof being admitted, as the word of cow is the cause of the power with

knowledge and comparison, as included in inference, are not different kinds of proof.

141.—This is not correct, as, independent of inference, verbal knowledge and comparison are intelligible.

142.—The connexion of the subject with the predicate is two-fold,⁹⁷ one positive and the other negative; the first has been explained, the other will now be explained.

reference to what is determined by the notion of cow. Or : The word Gayal is the cause of the power with reference to what is determined by the notion of Gayal on the ground, that trustworthy people have attached this meaning to it. By this inference the cause of the power with reference to what is determined by the notion of Gayal is evident, viz. because there is a connexion of a general proposition with a minor term.

This opinion is blamed in the text in the words : "This is not correct;" for without the knowledge of a general proposition (of the Vyāpti) an understanding is possible from the mere words. There is no proof, that after the hearing of words a general proposition is always necessary. Moreover, if it is assumed, that a general proposition (Vyāpti) is always required with reference to the understanding of words, why then is it not admitted, that it is necessary to assume a verbal knowledge with reference to the understanding of an inference ?

97.—*Comm.*—"The connexion of the subject with the predicate is twofold."

Namely, there are three kinds of inference, viz. only affirmative, only negative, and affirmative and negative at the same time.

1. The only affirmative kind takes place, when there are no dissimilar instances *with regard to the conclusion* (major term, that is to say, when the major term is not excluded from any other notion) for instance, if it is argued, that something is an object of knowledge, because it can be named ; for there is a dissimilar instance impossible, as every thing is an object of knowledge.

If it is said, 'that the only affirmative kind is impossible, because it is separated from all other notions' (that is to say, such a notion is separated from all other notions, and cannot therefore be connected with all.) We deny this ; for what is separated, is common to all, and this is

143.—The necessity of the absence of the conclusion where there is an absence of the reason, is the second.⁹⁹

merely affirmative. Moreover, the mere affirmation is the notion of a thing which is no object of actual absolute negation, and this is proved in the negation of the ether, * &c. (that is to say, as it cannot be proved, that ether, space, &c. are not found any where, so it cannot be proved with regard to such notions as knowledge, &c.)

2. Merely negative inference takes place, when there exist no similar subjects (of conclusion) for instance in the inference : Earth is distinguished from all the other elements, because it is possessed of smell ;† for in this case there is no similar instance, viz. no instance with which the conclusion is connected, because it was before excluded from the other elements.

3. Affirmative and negative inference take place, when there exist similar and dissimilar instances (of the conclusion or major term) for instance : This is fiery, because it smokes. In this case there are similar instances, as a hearth, &c., and dissimilar instances, as a lake, &c.

98.—*Comm.*—The cause of the negative conclusion is the knowledge of a general negative proposition. (Vyatirékavyāpti). For this reason the text defines the notion of a general negative proposition : “ A general negative is the necessity of the absence of the reason, where there is an absence of the conclusion ” (major term) that is to say, a general negative is the absence of the reason, which (absence) is included in the absence of the conclusion (major term). Here it must be understood, by what connexion, at what place, and by what notion the more extensive notion is comprehended, by the same connexion and notion is also the absence to be determined. From this knowledge it follows : by what connexion and notion the more comprehensive notion is comprehended, by the same connexion and notion is also the absence to be determined. Accordingly, where the absence of smell expresses the notion of the other elements by distinctive relation, &c. (see p. 7.) there

* Pratiyogi is that of which there is a negation (it is the contradictory opposition to its own negation) for instance a jar is the Pratiyogi of the negation of a jar. Apratiyogi is a thing, of which there is no negation, as for instance space, which is every where, and of which it cannot anywhere be said, there is no space.

† Here is “earth the minor term, the conclusion the distinction from what is different from earth, and the reason smell.

144.—Presumption* is not considered as another proof, because it is included in negative inference. Happiness, the object of desire of all worlds, is produced by virtue.

145.—Unhappiness the effect of vice, is absorbed by all conscious beings. The desire of happiness and of freedom from unhappiness arises from the knowledge of either."

146.—There is a desire of obtaining the means for those ends (avoiding misery and gaining happiness) if there is knowledge

follows the absolute negation of the notion of the other elements by the negation of the negation of smell; but where the more extensive notion of the other elements is comprehended by the relation of identity, there also is the negation of the other elements expressed by the relation of identity. This is reciprocal negation. And lastly, when by the relation of conjunction for instance the more extensive notion of fire with regard to smoke is comprehended, there the negation of smoke, determined by the relation of conjunction, in a tank also follows from the negation of fire, determined by the relation of conjunction. Here is the cause of the apprehension of the general negative proposition the knowledge of what agrees with a general negative. Others say: "By means of the negative the general affirmative is understood, but the knowledge of the general negative proposition, is not the cause. Where by means of the general negative the general proposition is understood, there it is called a negative inference. The necessity of the conclusion (major term, here the difference from the other elements) is first evident from single things, as a jar, &c. and afterwards it is established for the notion of earth" &c.

99.—*Comm.*—"The desire of freedom from unhappiness and of obtaining happiness arises from the knowledge of either."

Desire is *threefold*, viz. the desire whose object is the last end, (summum bonum, which is not the means to accomplish another object,) the desire whose object is a means (for something else) and the desire of action.

1. The desire whose object is the last end. The last end (उत्तम) is

* Vid. Col. M. E. Vt. p. 303. Presumption (arthāpatti, one of the five modes of proof of the Mīmāṃsakas) is deduction of a matter from that which could not else be. It is assumption of a thing not itself perceived, but necessarily implied by another which is seen, heard, or proven.

of these means. The wish to act is the desire determined by what may be accomplished by action.

147.—The cause of this is the knowledge of what may be accomplished by acts and what may accomplish the object of a desire. The knowledge, that something is the cause of an object which is strongly abhorred, is an obstacle.¹⁰⁰

148.—According to others the cause of the wish to act is the knowledge of what does not produce that abhorrence. The cause of aversion is the knowledge of what accomplishes things that are abhorred. Endeavour is of three kinds according to philosophers, viz. activity, cessation from activity and vital endeavour.

149.—The wish to act, the knowledge of what may be ac-

happiness and freedom from unhappiness. The cause of the desire of the last end is the knowledge of the same; therefore it is of itself the object of man; for it follows from the definition, that any thing, which, when known, is desired by its own nature, is the object of man, and its full meaning is, that it is the object of a desire, not dependent upon another desire.

2. The desire whose object* is a means (for something else.) The cause of this is the knowledge of what accomplishes an object of desire.

3. The desire of action is the desire, whose object is an effect to be accomplished by action, which (desire) is determined by the notion of what may be accomplished by action. This depends upon an apprehension such as this: I shall accomplish cooking by action. The cause of the desire of action is the knowledge, that an object may be obtained by action, and the knowledge, that the object of desire may be obtained. Therefore there is no desire of action with reference to rain, because it cannot be obtained by action.

100.—*Comm.*—"The knowledge, that something is the cause of an object which is strongly abhorred, is an obstacle."

* The object of a desire, independent of any other desire, is the last object; this is happiness and deliverance from unhappiness; for both are not desired for the sake of any thing else, but for their own sake. An object of a desire, depending upon another desire, is a secondary object; such are for instance, the fruition of love, eating, the removal of the unhappiness of another, the refraining from desires, &c.

accomplished by acts and what accomplishes such or such a desire, and the perception of the material causes produce activity.

150.—Cessation from activity rises from aversion produced by¹⁰¹ the knowledge of what accomplishes abhorred objects.

151.—Vital endeavour is constant,¹⁰² it transcends the perception of the senses¹⁰³;

152.—It is the cause of the flux and reflux of the vital airs in the body. Gravity abides in earth and water, it is imperceptible to the senses;

153.—It is transient in what is transient, and eternal in what is eternal. It is the non-intimate cause of the action which is called falling.

154.—Fluidity is twofold, innate and derived from a cause; the first abides in water, the second in earth and light;

155.—In the atoms of water it is eternal, in every other thing transient. Derived fluidity is produced in clarified butter and similar substances when heated by the union with fire.

156.—Fluidity is the cause of trickling and instrumental cause in a collection (heap). Viscidity abides in water; it is eternal in atoms, non-eternal in a compound.

For instance, there is no desire of action with regard to honey, mixed with poison, because the strong aversion is an obstacle.

(Material or intimate causes are those substances by means of which a desire is accomplished; for instance the material causes of a sacrifice are: the presence of ghee, wood, rice, &c.)

101.—*Comm.*—"Is constant;" which means, it lasts as long as life does.

102.—*Comm.*—"It transcends the perception of the senses; for the flux and reflux of the vital airs, *when stronger than usually*, is accomplished by endeavour, for instance a stronger inspiration (this is evident from perception). If this is the case, then from the inference, that the flux of the vital airs is accomplished by endeavour (for there must be a cause of it) and further from the inadmissibility of an endeavour that is perceived (for in the ordinary function of respiration, &c. it is not perceived) it follows, that the flux of vital airs is accomplished by an

157.—By the abundance of this (viscosity) in oil combustion is favoured. There are three kinds of faculty, viz. velocity, elasticity and memory.

158.—Velocity abides only in bodies, and is twofold, either produced by action or by velocity.¹⁰³ Elasticity is according to some only found in earth, according to others in the four first elements.

159.—It is imperceptible to the senses, and is sometimes the cause of vibratory motion.¹⁰⁴ The faculty which has the name of memory, is found only in sentient beings; it is imperceptible to the senses.

160.—Its cause is certitude without inattention.¹⁰⁵ Memory is called also the cause of remembrance and of recognition.

endeavour, which transcends the perception of the senses. This is vital endeavour.

103.—*Comm.*—"It is twofold, either produced by action, or by velocity." Velocity in an arrow arises from action produced by conjunction without noise, (vid. v. 118,) hence from the destruction of a former action arises another action. In the same manner all the subsequent actions must be considered. And without velocity, since one action is an obstacle to another, the destruction of a former action, and the production of a subsequent one were impossible. Where velocity is effected by velocity, for instance, where the velocity in a jar is effected by the velocity of its half, there is velocity, produced by velocity.

104.—*Comm.*—Elasticity is proved for instance by the fact, that a branch which is attracted, returns to its former position, when released. The opinion of some, that elasticity abides in the four first elements, is not supported by any evidence.

105.—*Comm.*—"Its cause is certitude without inattention." If it is said: 'Is certitude, different from inattention, rather not the cause of remembrance? And if this is the case, let us say, that knowledge in general is the cause of memory.'

We object; for as there is no authority of assuming an alternative, it is evident, that certitude, different from inattention, is the cause of memory. Moreover, with reference to inattention, the assumption of

161.—Fate is twofold, merit and demerit. Merit is the means by which heaven, &c. is obtained.¹⁰⁶ It is a practice of ablutions in the Gangā, &c. and of sacrifices, &c.

162.—It is thought perishable by the contact with the water of the Karmanāsā.* Demerit is the cause of hell, &c. and is produced by blamable works.

163.—It may be destroyed by expiations, &c. Both qualities abide in living creatures.¹⁰⁷ They are produced by desire and destroyed likewise by knowledge.¹⁰⁸

memory is complicated (superfluous) and hence it is proved, that certitude, different from inattention, is the cause of memory.

The proof of this is given in the words : " It is called the cause of remembrance and recognition." That is to say, memory produces remembrance and recognition ; therefore memory is assumed, for it is impossible, that a former perception produces, without intercourse, remembrance, because a cause is impossible, if it is not in respective intercourse with either of the two (remembrance or recognition.) Nor can it be said, ' that, as memory, determined by the category of identity, is the cause of recognition, remembrance is obtained, because recognition is produced by memory ;' for there is no cause for this.

106.—*Comm.*—"Merit is the means by which heaven, &c. is obtained."

That is to say, it is the means of obtaining the happiness of heaven and all other happiness, and of bodies fit to enjoy the happiness of heaven.

107.—*Comm.*—" In living creatures," because merit and demerit cannot be assigned to God.

108.—*Comm.*—" They are produced by desire, and destroyed likewise by knowledge."

" By desire," that is to say, if good or bad acts are done by one who has perfect knowledge, they are of no effect. " Likewise by knowledge." " Likewise" is said to indicate enjoyment.

' But how (it may be objected) can the knowledge of truth destroy merit and demerit? for this (the destruction of merit and demerit)

* The name of a small river, which separates the territory of Benares, Kāśī, from Bihar.—Vid. Lassen's Ind. Alterth. Vol. I. p. 130.

164.—There are two kinds of sound, inarticulate and articulate; the first is produced by a drum, &c. and the latter, as ka and other letters, by the contact of the throat with the palate.

165.—Every sound abides in the ether, but it is perceived, when it is produced in the ear.¹⁰⁹ Some say, its production takes place like a succession of waves.

would be contrary to the passage (of the *Yoga-sūtra*): “An action, of which the effect is not experienced (which has not produced its due consequence in the soul of the agent, viz. happiness, if a good action, and unhappiness, if a bad one) does not perish even in a hundred crores of Kalpas.” If this is the case, then the destruction of *merit and demerit* takes place in this manner, that a person who knows the truth, experiences the consequences of all *his* works at once by all his bodies.’ (viz. all the bodies which he is to assume in future births.)

There, however, “to experience the consequences of works,” is only given as an example of the various ways, in which *works* are destroyed according to the *Védas*. How could otherwise works be destroyed by expiations? &c. It is said (in the *Bhagavadgīta*.) “The fire of knowledge consumes all works.” And in the *Sruti*: “All his works perish, when the general and individual souls are known.”

If it is said: ‘In this case there cannot exist for him who knows truth, the state of the body, nor happiness, unhappiness, &c. as by knowledge all works are destroyed,’ we object; for only the works different from those which are commenced, are destroyed; for only the work which is the cause of the enjoyment of this or that body, has been commenced.

109.—*Comm.*—“Every sound abides in the ether, but it is perceived, when it is produced in the ear.”

Abiding in the ether, means, that the ether is its intimate cause. As a sound, when distant, is not perceived, it is said, “in the ear.” As it may be doubted, how a sound, produced in the space, determined by a drum, &c., is produced in the ear, it is said: “Its production takes place like a succession of waves,” its sound produces another, determined by a space, external to the first, and the second produces again a third, and so on. In this manner it is perceived, when it is gradually produced in the ear.

166.—According to others, like the bud of the Kadamba plant.¹⁰ From the knowledge,¹¹ that the letter ka is produced, and that it is destroyed, non-eternity of sound would follow.

167.—The knowledge, that this ka is that ka, depends upon the perception of general knowledge.¹² "This is the medicine," such and other sentences depend upon general knowledge.

110.—*Comm.*—"Like the bud of the Kadamba plant." In this manner: From the first sound ten sounds are produced in the ten divisions of space. Hence ten other sounds are produced. As this assumption is complicated, it is said in the text: "according to some."

111.—*Comm.*—"From the knowledge," &c. To remove the objection, that sound is not produced, because it is eternal, it is said: "From the knowledge," &c.

112.—*Comm.*—If it be objected: 'The eternity of sound follows from the fact, that this letter ka is recognised as that letter ka,' the text gives the answer: The knowledge, that this ka is that ka, depends upon community of class, &c. Here is the object of recognition, the community of class of this and that object, but not the identity of this and that individual; because it is contrary to the knowledge which has been mentioned. If this is the case, there cannot be a mistake with regard to those two perceptions (*vis.* sound is not eternal, and this is that sound).
